ABSTRACT

This study attempted (1) to identify factors relating positively and negatively to job placement of postsecondary vocational-technical education students; (2) to provide detailed descriptions of the education and community processes appearing to influence job placement; and (3) to generate hypotheses concerning variables relating to job placement. Data for the study came from a review of the literature, case studies, and a mail questionnaire received from 2,599 persons in 31 postsacondary institutions. Concerning the postsecondary educational institutions, findings indicated that higher job placement seems to occur in institutions in which (1) personnel and teachers are committed to and enthusiastic about the placement of students in a job related to their training; (2) administrators and teachers are committed to interactions among community, labor, and business organizations in order to support job placement; (3) job placement specialists and counselors serve as the initial sources of information about job openings and provide clearinghouse and support functions; (4) advisory committee input is sought; (5) planning is related to community and state economic development efforts, especially to anticipated labor demand and supply; (6) work experience programs are available; and (7) job placement rates are used as a program evaluation criterion. Higher job placement rates were also found in postsecondary institutions where there is a high demand for labor in the surrounding area; and the medium-sized community is supportive of vocational-technical education. Recommendations for action were made to Congress, the Department of Education, state government agencies, postsecondary institutions, and teacher education institutions. (KC)

Disclaimer:

This publication was prepared pursuant to a contract with the Office of Vocational and Adult Education, U.S. Department of Education. Contractors undertaking such projects under Government sponsorship are encouraged to express freely their judgment in professional and technical matters. Points of view or opinions do not, therefore, necessarily represent official U.S. Department of Education position or policy.

Discrimination Prohibited:

Title VI of the Civil Rights Act of 1964 states: "No person in the United States shall, on the grounds of race, color, or national origin, be excluded from participation in, be denied the, benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance." Title IX of the Education Amendments of 1972, Public Law 92-318 states: "No person in the United States shall, on the basis of sex, he excluded from participation in, be denied the benefits of, or be subjected to discrimination under any education program or activity receiving Federal financial assistance." Therefore, the National Center for Research in Vocational Education Project, like every program or activity receiving financial assistance from the U.S. Department of Education must be operated in compliance with these laws.

FOREWORD

Employment in a job relacted to training is a widely accepted out ome of postsecondary vocational-technical education programs. Even those persons who view training-related job placement as a supplemental rather than as a primary purpose of vocational-technical education do not deny that job placement is an outcome which represents the expectations of most of those receiving, providing, and supporting postsecondary vocational-technical education programs.

Given the importance of job placement as an outcome for vocational-technical education, it is logical to assume that policymakers and decision makers at the federal, state, and local levels have great need for information that allows them to optimize the allocation of limited resources toward the achievement of high rates of job placement for former postsecondary This study 'attempts to vocational-technical education students. identify factors influencing the placement of former postsecondary vocational-technical education students in jobs related to their training. In addition to the identification of the 'factors, that influence placement, the study findings provide a description of the education and community processes that appear to influence the placement of former postsecondary vocational-technical education students in jobs related to the r training.

From a methodological viewpoint, this study should be of interest to vocational-technical educators. The study represents one of the early efforts of researchers in vocational-technical education to combine qualifitative and quantitative approaches in a sizable effort to address a complex problem.

This report is the second of two reports prepared by National Center staff to provide information about the factors relating to the placement of former vocational education students in jobs related to their training. The first report, Factors Relating to the Job Placement of Former Secondary Vocational Education Students, was published in 1981 and focused on secondary vocational education programs. This inquiry included case studies at eight local school sites, an analysis of existing data (586 LEAs in seven states), and mail questionnaires (ten respondent groups in sixty-two LEAs in the same seven states).

A number of distinguished persons provided advice and assistance in planning and conducting the study. A list of these individuals can be found in the Appendix. The National Center is most appreciative of the help provided by these individuals.

xvii

The National Center is indebted to the staff members who worked on the study. The study was conducted in the Evaluation and Policy Division under N. L. McCaslin, Associate Director. Floyd L. McKinney, Senior Research Specialist, served as Project Director. The project staff members were: Stephen J. . Franchak, Senior Research Specialist; Ida M. Halasz, Research Specialist; Ifene Morrison, Program Associate; Douglas McElwain and Patricia Fornash, Graduate Research Associates; and Priscilla Ciulla and Sherry White, Secretaries. Final editorial review of this report was provided by Brenda Sessley and Sharon Fain of the National Center's the Editorial Services area.

Robert E. Taylor Executive Director
The National Center for Research
in Vocational Education

EXECUTIVE SUMMARY

Historically, vocational-technical education has been evaluated on the basis of the number of former students placed in jobs related to the training they received. As policymakers and decision makers have attempted to achieve higher job placement rates, they have been frustrated by a lack of information about those factors that seem to influence student job placement. This study attempted (1) to identify factors relating positively and negatively to job placement, (2) to provide detailed descriptions of the education and community processes appearing to influence job placement, and (3) to generate hypotheses concerning variables relating to job placement.

Data for the study came from a review of the literature, case studies, and a mail questionnaire. The study was conducted in four states. The case studies were conducted in one post-secondary institution in each of the four states. Mail questionnaires were received from 2,599 individuals representing eight respondent groups in thirty-one postsecondary institutions in the four states.

Conclusions

The following statements should not be regarded as final conclusions concerning the factors affecting the placement of former students in jobs related to their training. The statement should be considered as working hypotheses, to be tested again and again in the ever-changing context in which vocational-technical education programs operate.

Education

Higher job placement seems to exist in those postsecondary institutions where:

- o Postsecondary institution personnel and teachers are committed to the placement of students in a job related to training as the major goal for the vocational-technical education programs
- o Postsecondary institution personnel are enthusiastic about the placement of students in a job related to their training as the major goal for the vocational-technical education programs

- O Teachers are enthusiastic about the role they play in ensuring that students are placed in jobs related to their training
- Administrators are committed to and encourage essential interactions among community organizations, labor, business, industry, and postsecondary institution personnel that promote open communication to support job placement
- O Teachers maintain frequent and meaningful contacts with the business and industrial community
- o The vocational-technical education curriculum is relevant and responsive to the needs of employers
- Job placement specialists and counselors serve as the initial sources of information about job openings for teachers and students
- O Job placement specialists and counselors provide a clearinghouse function and a support function (secretarial assistance, telephone, job listings) for information about jobs
- Advisory committee input is used in planning vocational technical education programs
- o Planning in the postsecondary institutions is coordinated with community and state economic development activities, especially those activities related to labor supply and demand
- o Job placement rates are used as a program evaluation criterion.
- o Program evaluation efforts are systematic and comprehensive
- o Student performance is evaluated on employability skills such as preparing resumes, and interviewing
- O Teachers keep up to date with the latest trends in the occupational fields
- o Programs providing students with "real world" work experiences are available to students

Labor,

Higher job placement seems to exist in those postsecondary institutions where:

o There is a high demand for workers in the surrounding labor market area. However, high labor demand does not always result in high job placement. Higher job placement tends to result when the postsecondary institutions vocational-technical education programs are specifically oriented to the high skill labor demand areas. Labor market conditions over which vocational-technical educators have no control are at least as important as the nature of vocational education itself in determining job placement

Community

Higher job placement seems to exist in those postsecondary institutions where:

- o The community is supportive of vocational-technical education
- O The postsecondary institution is located in medium-size communities

Recommendations

The study recommendations are directed toward agencies or policymaking groups who have historically developed and/or enforced policies and decisions regarding vocational-technical education programs.

Congress

It is recommended that Congress:

- o Recognize that vocational-technical education programs operate with multiple goals and therefore do not specify the specific criteria for the evaluation of such ' programs'
- o bevelop legislation that is flexible enough to allow state agencies to develop funding formulae that will encourage postsecondary institutions to conduct activities enhancing job placement

U.S. Department of Education

It is recommended that the U.S. Department of Education:

- o Encourage further research about the factors relating to job placement especially in isolated areas, inner cities, and areas with unique labor market or geographical locations
- o Encourage the dissemination of findings regarding the factors relating to job placement through the funding of symposia, workshops, monographs, and widely distributed publications

State Government Agencies

- It is recommended that state governing agencies:
- vevelop funding formulae that reward postsecondary institutions for implementing activities that enhance job placement
- o Provide teacher education institutions and postsecondary institutions with funding to conduct inservice education programs for teachers and administrators concerning the factors relating to job placement
- o Promote professional development activities that assist teachers in keeping.up to date in their occupational skill area

Postsecondary Institutions

It is recommended that postsecondary institutions:

- o Develop clear statements of the goals for postsecondary vocational-technical education programs
- o Promote and reward enthusiasm for placing students in jobs related to training
- o Encourage frequent and active meetings of citizen advisory committees and utilize their recommendations in program planning and evaluation
- o Use job placement data as a major criterion for evaluating programs

- O Recognize the importance of the role of teachers in the job placement process by including teacher performance concerning job placement in considerations for tenure, promotions, and salary adjustments
- o Recognize the importance of the role played by chief administrators and deans/directors in the job placement process. Reward chief administrators and deans/directors for their leadership and allocation of resources to attain institutional goals concerning job placement
- o Develop and maintain systematic processes for ensuring that the vocational-technical education curriculum is relevant and responsive to the needs of business and industry
- O Develop and maintain current and relevant job placement information in a central location that is easily accessible to teachers, job placement specialists, counselors, administrators, and students
- o Provide teachers with clerical support to assist in maintaining contact with employers and in preparing recommendations for students
- Use local labor market information in program planning and evaluation
- o Maintain close contact with other agencies involved in job development/job placement in the community

Teacher Education Institutions

Lt is recommended that teacher education institutions:

- o Include in the courses required for postsecondary institution administrators, information concerning the goals of postsecondary vocational-technical education programs, information about those factors enhancing the attainment of the goals, and information about the vital role of deans/directors in determining whether former students are placed in jobs related to their training
- o Impart to future vocational-technical educators the significant role teachers play in determining the placement of former students in jobs related to their training
- o Seek innovative ways to provide current education personnel with information about methods that will enhance job placement

xxiii

CHAPTER I

PURPOSE AND OVERVIEW OF STUDY

This report is the second of two reports that provide information about the factors relating to the placement of former vocational education students in jobs related to their training. The first report, Factors Relating to the Job Placement of Former Secondary Vocational Education Students, was produced by the National Center in 1981 and concerned secondary vocational education programs.

In this chapter, information is provided concerning the need for the study, study goals and objectives, the study's dependent variable, conceptual framework developed for the study, study approaches, major issue areas, and study research questions.

Need

Histofically, the placement of students in jobs related to training has been the primary criterion used in evaluating vocational-technical education programs. In recent years the placing of students in jobs related to their training has assumed even greater importance in vocational-technical education. 1976, P.L. 94-482, popularly known as the Education Amendments of 1976, was enacted. A portion of this legislation mandated that each state systematically evaluate its vocational education programs and identified the primary evaluative criterion as the. extent to which completers and leavers find employment in occupations related to training. Also in the 1970s a school-based job placement movement developed. While this movement has a lengthy history, its ultimate goal has been to make school-based job placement services available to all secondary and postsecondary students. In addition, there has been a chronic unemployment problem in the United States. The problem. is especially acute among female, minority, and lower socioeconomic class youth. Together, these three events (among others) have focused the attention of education, business/industry, and government on the job placement of students trained in publicly supported institutions.

Traditionally, federal, state, and local education agencies have collected information through follow-up studies intended in

part to identify the extent to which vocational—technical education program completers find employment in occupations related to the ritraining. One major problem with the information obtained through follow-up studies is that it does not adequately address the question of what factors and processes have an important influence on the job placement of former postsecondary vocational education students. Without information on the factors influencing the job placement process, vocational—technical educators face difficulties in making recommendations to enhance the placement of students in jobs related to their training. If policy—makers and decision makers are to optimize the use of resources, it is essential that they have information concerning those factors affecting the placement of former students in jobs for which they were trained.

Goals and Objectives

The overall goal of this study was to produce knowledge that can be used in determining policy and making decisions to improve the job placement rates of vocational-technical education, programs. The objectives of the study were --

- to identify factors relating positively or negatively to the placement of former postsecondary vocational technical education students in jobs related to their training;
- 2. to provide a detailed description of the educational and community processes that appear to influence former vocational-technical education students being placed in jobs related to their training;
- 3. to generate hypotheses concerning variables relating to the placement of postsecondary vocational-technical education students in jobs related to their training..

Dependent Variable

The dependent variable for the study was the percentage of former postsecondary vocational-technical education students available for placement who were employed in a field related to their training.

Conceptual Framework

In this study, the job placement rate provided by state and local postsecondary governing agencies was viewed as a measure of the ability of a vocational-technical education program within a postsecondary institution to effectively attain the goal of placing students in jobs related to their training upon their leaving

the vocational-technical education program. This conceptualization of job placement focused the initial generation of issue areas and of research questions on vocational-technical education processes and school activities that were intended to achieve the outcome of job placement for students leaving the program. Priority was given to those processes and activities that appeared to be links in explaining why vocational-technical education, as a distinctive education treatment, influences high job placement rates. In addition, the educational activities are more important to policymakers and decision makers because they tend to be processes or activities that can be manipulated.

This conceptualization, in and of itself, did not provide clear direction as to what processes or activities are needed, required, or desirable to achieve high job placement rates. The conceptualization did suggest, however, that different compositions of processes and activities in different contexts will result in variations in the outcome of training-related job placement.

Although emphasis in this conceptualization focused on education factors, it was realized that other types of factors influence youth and adult employment, e.g., labor market demand, minimum wage laws, etc. Therefore, two other types of factors (labor market factors and community factors), were included.

The framework was developed using information from a literature review and input from consultants. Numerous research reports, for example Robock (1978), noted that several factors contribute to youth attaining jobs:

- Size and economic characteristics of the community
- O Capabilities and policies of local employment service/job service offices
- o Characteristics of the public school system
- O Hiring practices of large and small employers in the community
- O Role of community based organizations in economic and education affairs
- of Patterns of cooperation among employers, labor unions, educational institutions
- Community attitudes toward education and work

Education factors were emphasized by a panel of consultants serving as an advisory group for the study. (See Appendix A for a listing of individuals serving as consultants to the study.)

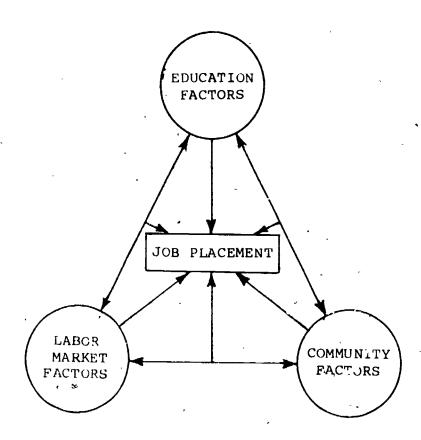

The Evaluation Technical Advisory. Panel members reviewed the study design and the conceptual framework. Many of their suggestions were used by the project staff.

The conceptual framework around which the study was organized is displayed in figure 1.1. The framework was used as a starting point for identifying and organizing possibly significant factors influencing job placement.

FIGURE 1.1

HFURISTIC FRAMEWORK FOR FACTORS INFLUENCING JOB.PLACEMENT

The framework suggests that in the transition from school to work three broad categories of factors have an impact on the obtainment of jobs by young people. These interacting categories are labeled education factors, labor market factors, and community factors.

Study Approaches

The research approaches used in the study included a literature review, case studies, and mail questionnaires. A detailed description of these approaches is provided in Chapter II.

Issue Areas.

Broad issue areas were identified by the National Center staff at the beginning of the study. These areas were identified from reviewing the literature, staff experience, and assistance from consultants who represented a wide variety of backgrounds and experience. The issue areas further extended the framework (figure 1.1) and served as a basis for generating the research questions used in the quantitative aspects of the study.

The initial issue areas identified were:

A. Labor Market

- 1. Employer profile
- Labor market demand and supply.
- Unionization
- 4. Growth/decline of economy
- 5. Occupational mix

B. Community

- 1. Size
- 2. Social mobility
- 3. Racial composition
- 4. Income level and distribution
- 5, Political consideration.
- 6. Youth training programs

C. Education

- 1. Management and administration
- Policy and planning processes
- 3. Resource allocation
- 4. Program Evaluation
- 5. Needs assessment
- 6. Personnel development
- 7. Facilities and equipment,
- 8. Personnel qualifications
- 9. Business/industry involvement
- 10. Curriculum
- 11. ' Student organizations
- 12. Cooperative work programs
- 13. Student evaluation

- 14. Job placement processes and outcomes
- 15. Follow-up system
- 16. Philosophical commitment.
- 17. Legislation

Research Questions

Using the framework presented in figure 1.1, and the issue areas identified in the preceding section, research questions to be addressed in the study were generated. These questions were developed using project staff expertise, input from the advisory committee mentioned earlier, suggestions from the Evaluation Technical Panel, and advice from individual consultants.

In the mail questionnaires, the research questions were divided into two categories: descriptive questions and analytical questions. As the names of the categories imply, the descriptive questions called for a description of ongoing placement practices while the analytical questions focused on variables hypothetically influencing placement rates. The dependent variable associated with the questions was the ratio of the percent of vocational education students placed in training-related jobs to the percent of students available for placement.

The research questions guiding the analysis of data from the mail questionnaires evolved from the broad issue areas identified by the project staff. The issue areas also provided the organizing framework for conducting the case studies and for analyzing and writing the study findings. The information in figure 1.2 shows the relationship between the issue areas and research questions. The descriptive research questions identified according to the broad issue areas were as follows:

Community

- 1. What are the perceptions of postsecondary personnel and employers regarding the comparisons of former vocational-technical education students to experienced workers in terms of employability?
- 2. How do employers think workers trained in vocational technical education compare on the job to workers who have not received vocational-technical education?
- 3. What are the factors that are perceived to enhance the employability of former vocational-technical education students?

Labor Market

- 4. What kinds of firms in the labor market areas surrounding the postsecondary institutions hire former vocational-technical education students?
- 5. How large are the firms that hire former vocational technical education students from the postsecondary institutions?
- 6. Do employers of former vocational-technical education students from postsecondary institutions have labor unions present in the r firms?

Education

- 7. What are the perceptions of postsecondary institution personnel regarding the comparison of vocational technical education students to nonvocational-technical education students in terms of employability?
- 8. How many students obtained employment after leaving their vocational-technical education programs?
- 9. How many students obtained employment in training related jobs after leaving their vocationaltechnical education programs?
- 10. What factors are perceived to present difficulties to former vocational-technical education students obtaining jobs?
- 11. How many of the postsecondary institutions included in the study conduct assessments of employer skill needs?
- 12. What are the requirements for admission into the vocational-technical education programs in the post-secondary institutions included in the study?
- 13. Do employers participate in the postsecondary vocational-technical education programs?
- 14. What is the rate of student participation in work-study or cooperative education programs in the postsecondary institutions in the study?
- 15. How many of the postsecondary institutions included in this study provide instruction in job-seeking and job-obtainment skills?

- 16. How often do the postsecondary institutions included in the study contact employers regarding the job placement of students?
- 17. How often do employers contact the postsecondary institutions included in the study regarding job openings for which former vocational-technical education students might qualify?
- 18. How effective is the postsecondary institution as perceived by staff and vocational-technical education students in providing various job placement services?
- 19. What types of job placement services are provided by the postsecondary institutions in the study?
- 20. How many postsecondary institutions in the study have formalized job placement offices?
- 21. What members of the postsecondary institution staff participate in performing job placement activities?
- 22. How much work time is spent by postsecondary institution staff in performing job placement activities?
- 23. How many vocational-technical education students use the job placement services of the postsecondary institutions in the study?
- 24. What persons/agencies are perceived to be the most helpful to students in identifying job openings?
- 25. What person/agency should have primary responsibility for job placement as perceived by vocational-technical education students and vocational-technical education personnel?
- 26. What sources of information regarding job openings are perceived by postsecondary institution personnel and students as most helpful to vocational-technical education students in finding jobs?
- 27. How often are the vocational-technical education programs evaluated in the postsecondary institutions included in the study?
- 28. How frequently do the postsecondary institutions included in the study conduct follow-up studies of former students?
- 29. What are the professional responsibilities of postsecondary institution staff?

- 30. How many of the vocational-technical education teachers in postsecondary institutions hold certificates in their area of teaching?
- 31. What is the ratio of female to male students enrolled in the vocational-technical education programs in the postsecondary institutions in the study?
- 32. What is the ratio of nonwhite to white students enrolled in the vocational-technical education programs in the postsecondary institutions in the study?
- 33. What is the distribution of the vocational-technical education student grade point averages in the post secondary institutions in the study?
- 34. What are the career plans of vocational-technical education students enrolled in the postsecondary institutions in the study?
- 35. In what ways do advisory committees assist the postsecondary institution vocational-technical education program?

The analytical questions identified were as follows:

Labor Market

1. Is the presence (or absence) of unions in firms employing former vocational-technical education students of site postsecondary institutions associated with job placement rates?

Education

- 2. How does enrollment in a particular vocationaltechnical education program affect the relationship between participation in vocational-technical education student organizations and employment in training-related jobs?
- 3. Is the postsecondary institution's rate of student participation in work-study/co-op programs associated with job placement rates?
- 4. Is student participation in work-study/cooperative education programs associated with student employment after leaving the program?

- 5. Is student participation in work-study/cooperative programs associated with student employment in training-related jobs upon leaving the program?
- 6 What is the relationship between participation in work study/cooperative program and job placement by vocational technical education program areas?
- 7. Do postsecondary institutions that provide job placement services have higher job placement rates than postsecondary institutions that do not provide such services?
- 8. What types of job placement services are associated with high job placement rates?
- 9. Is the postsecondary institution's rate of student utilization of job placement services associated with job placement rates?
- 10. Is the amount of time spent by the postsecondary institution staff on performing job placement activities associated with job placement rates?
- 11. Is the provision by postsecondary institutions of job seeking and job-obtainment skills associated with job placement?
- 12. Is the level of perceived effectiveness of postsecondary institutions in providing job placement services associated with job placement rates?
- 13. Is the frequency of evaluation of vocational-technical education programs in the postsecondary institutions include, in this study associated with the postsecondary institution's job placement rates?
- 14. Are there higher to placement rates at postsecondary institutions where the students give high ratings to their vocational-technical education experiences?
- 15. Is the use of employer needs assessments by postsecondary institutions associated with higher job placement sates?
- 16. Is the average leigth of time spent teaching by the vocational-technical education staff in postsecondary institutions associated with job placement rates?
- 17. Is the average length of time spent by the postsecondary institution's vocational-technical education teachers in occupational areas related to their training areas associated with their students' job placement rates?

- 18. Is the percent of female enrollment, in the postsecondary institution's vocational-technical education programs associated with the institution's job placement rate?
- 19. Is the percent of male enrollment in the postsecondary institution's vocational-technical education programsassociated with the institution's job placement rates?
- 20. Is the percent of white enrollment in the postsecondary institution's vocational-technical education programs associated with the institution's job placement rates?
- 21. Is the percent of nonwhite enrollment in the mostsecondary institution's vocational-technical education programs associated with the institution's job placement rate?
- 22. Is performance—in postsecondary institutions, expressed by grade point average, associated with former student employment in jobs related to training?

CHAPTER II

STUDY PROCEDURES

In this chapter the procedures used in conducting the study are described. Information is presented regarding the study approaches and the sampling plan.

Study Approaches

In order to provide a rich pool of information for analysis, the project staff used three different research approaches: a literature review, case studies, and mail questionnaires. These study approaches were deliberately chosen in order to produce a mixture of qualitative and quantitative data. By combining qualitative data from the case studies with the quantitative data available from the mail questionnaires, the project staff was able to substantiate findings from more than one source. An overview of the study is shown in figure 2.1.

Literature Review

The literature review was conducted in order to fulfill three objectives. The objectives were

- to determine previous research in the area of training-related job placement for former vocationaltechnical education students that would influence the present study.
- to identify existing information relevant to the study's research questions.
- 3. to assess where additional information is needed to extend or modify what is known about the job placement of former vocational-technical education students.

In the literatyre review, minimal attention was given to the numerous annual former student follow-up studies conducted by state and local education agencies. This decision was made because: (1) follow-up studies usually report statistics on placement rates of former students, but they do not provide much

· .

ՄՆ

insight into the processes producing these rates, and (2) methodological and design differences between follow-up studies prevent the drawing of general conclusions regarding job placement (Copa and Forsberg 1980, Mertens et al. 1980). In addition, attempts to focus specifically on training-related job placement proved almost fruitless. In the literature dealing with placement, the distinction between training-related and nontraining-related jobs was rarely made. McKinney, Gray, and Abram (1978) also pointed out that training-related placement is defined differently by researchers and by those providing the placement data, thus contributing to the problem of generalization across studies:

Literature was obtained from a number of sources. Reports were sought from Research in Education (RIE), Abstracts of Instructional and Research Materials in Vocational Education (AIM/ARM), Resources in Vocational Education (RIVE), Current Index to Journals in Education (CIJE), Educational Research Information Center (ERIC), and Social Sciences Retrospective of the Ohio State University's Mechanized Information Center. Reports addressing the three categories of factors in the study's conceptual framework (community characteristics, education processes, and labor market characteristics) were obtained and reviewed.

Case Studies

The case studies were designed to obtain data in four ways: interviews, observations, document reviews, and record reviews. Interviewing methods were based upon the elite (openended) technique developed by Dexter (1970). Within this framework, the interviewer sets the context of the interview and then allows the interviewees to respond in their own manner, During the interview each interviewee was treated in a way that stressed the interviewee's definition of the situation, encouraged the interviewee to structure the account of the situation, and allowed interviewees to individually introduce their own notions of what they regarded as relevant instead of relying upon the investigator's notion of relevance.

Prior to or concurrent with the visits to the postsecondary institutions, one project staff member interviewed appropriate personnel in the state governing agency. During these visits, state officials were interviewed to obtain a state-level perspective about factors influencing job placement. In addition, relevant state documents and records were obtained. Examples of documents and records included reports of program evaluation studies, and job placement studies.

A project staff member visited each case study site prior to a two-week stay at each site. This initial visit enabled project staff to brief postsecondary institution officials at the case study site on the purposes and techniques of the study and

to schedule interviews and observations for the first few days the staff would be on site. This initial of fact with personnel at the site provided an opportunity to of an records and to collect documents. Examples of records a forments obtained from postsecondary institutions included overning board policy manuals, advisory committee minutes of meetings, chamber of commerce information about local business/industry, and program evaluation studies. Project staff members reviewed the collected documents and records prior to traveling to the site to acquaint themselves with as many of its unique features as possible.

Two project staff members were usually on site for two During this time, approximately sixty to seventy interviews were conducted in addition to the time scheduled for observation and document review. Typically, interviewees represented teachers, counselors, job placement specialists, deans, department heads, chief administrative staff, employers, directors, advisory committee members, current students, former students, and community personnel such as chamber of commerce representatives and state employment office staff. interviews averaged forty-five minutes in length. individuals participated in second and occasionally third interviews. The individuals interviewed a second and third time were able to provide additional information and/or to assure the accuracy of information. While interviews were scheduled to include representatives of the aforementioned groups, interviewers were encouraged, based upon the information they obtained from previous interviewees, to interview persons who seemed to possess "key information" about the job process at the site.

After each day's interviews, observations, or document reviews, the project staff members on site were able to discuss the interactions, solve any emerging problems, and plan the subsequent work. Modifications and adjustments of language, approach, and emerging issues were made on a consensual basis.

All the information collected in the case studies was coded according to the major issues areas as shown in figure 1.2. This organization of the data permitted the project staff to retrieve information relative to a specific issue area.

On the final day at the case study site, team members met with postsecondary institution administrators and staff members to discuss with them the impressions they had gained from the case study. After returning to the National Center, reports were prepared using the coded information from the sites.

Data analysis procedures. Patton (1980) writes, "There are no formal, universal rules to follow in analyzing, interpreting and evaluating qualitative data (p. 268)." Patton's definition of analysis and interpretation is helpful in understanding how

the case study information was analyzed.

'Analysis is the process of bringing order to the data, organizing what is there into patterns, categories, and basic descriptive units. Interpretation involves attaching meaning and significance to the analysis, explaining descriptive patterns, and looking for relationships and linkages among descriptive dimensions (p.238).

The project staff has described the patterns that appear to be present in the data. Those patterns represent the perspective of the project staff members based on their understanding of the data collected. As with any data, the readers will judge these interpretations in view of their own understanding of post-secondary vocational-technical education and the environment in which such programs operate.

The analysis of the case study information focused on the study problem and the initial issue areas presented in Chapter I. The notes collected from the interviews, observations, documents, and records were written or dictated by the project staff. this initial write up or dictation was being done, the data were organized according to the Initial issue areas. The first step of analysis was the coding of the information. As the coding continued it became apparent that the initial listing of issue areas was incomplete. Additional issue areas were added, and some issue areas were combined or defined in slightly different ways. As project staff worked with the data, there was a continuing search for recurring regularities in the data. These regularities merged in to patterns that could be assigned to homogeneous The project staff maintained a keen awareness of issue areas. the need to detect divergence in the data from high and low placement sites (The "Sampling Plan" section of this Chapter presents more in ormation about high and low placement sites). It is important to note, once again, that the ways by which the data were categorized (issue areas) were always driven by the study problem.

Several staff members worked on the data analysis. This provided opportunities for diversity of opinions to surface. The comparison and discussion of these differences frequently led to the emergence of important insights about the factors relating to job placement.

As the project staff analyzed the data there was a continuing search for relationships of factors (variables) and job placement. The determination of relationships was a time consuming process. The effort was accurately described by Patton (1980) as a process of:

...constantly moving back and forth between the phenomenon of the program and our abstractions of that program, between the descriptions of what has occurred and our analysis of those descriptions, between complexity of reality and our simplifications of those complexities, between the circularities and inter-dependence of human activity and our need for linear, ordered statements of cause effect..(p.268).

This frequently resulted in other possible findings being suggested and a determination being made to see if there were sufficient data to support the new suggestion. In addition, the data were verified by the checks and balances resulting from the combination of qualitative and quantitative data in the study.

In this study the project staff was more interested in emerging descriptive patterns for the individual sites. The staff recognized the value of considering emerging patterns across all sites and this was done in the correlational, regression and discriminant function analysis of the mail questionnaire data. However, the need to analyze all of the data by state was necessary due to the many differences among state governance structures, local postsecondary institution characteristics, and enormous variation in job placement rates.

Mail Questionnaires

Another major data collection effort involved the use of mail questionnaires. The development of mail questionnaires to send to prospective respondents in the postsecondary institutions was aided greatly by the information gained from the development of the mail questionnaires for the sampled groups in the secondary schools. Most of the secondary questionnaire items were appropriate for inclusion in the postsecondary questionnaire. The following information describes the procedures used in developing the questionnaires.

Work on developing eight questionnaires (refer to Appendix B for copies of each questionnaire) was divided into four phases:
(1) identification of variables to be incorporated into each questionnaire; (2) development of the format and specific questionnaire items; (3) pilot testing of the questionnaire; and (4) approval by the Federal Education Data Acquisition Committee (FEDAC).

Instrument development. In phase one of the development of the instruments, project staff were involved in a number of activities concerned with identifying the major variables considered to be related to job placement. First, a review of

literature was completed. Second, a number of persons were asked to consult with project staff in identifying appropriate variables for consideration. For this activity, both formal and informal techniques were used. Informal techniques involved such activities as telephone conversations with state and local persons and analysis of information from meetings dealing with job placement and related areas. Formal techniques used included the conducting of a seminar focusing on variables relating to job placement, and gathering information from the Evaluation Technical Advisory Panel. The persons involved in both the informal and formal techniques included, but were not limited to, state and postsecondary institution vocational-technical education administrators, vocational-technical education practitioners (teachers, counselors, job placement specialists), sociologists, labor economists, psychologists, and employers. These persons brought both substantive and methodological knowledge to the process of defining the information needs for the mail question-Moreover, the project aff informally interacted with individual representatives of the eight respondent groups to identify the kind of information that was feasible in a survey of this nature. The heuristic framework displayed in figure 1.1 was developed as a result of the above mentioned activities. The information in figure 2.2 shows a more detailed breakdown of the heuristic framework. Using the areas identified in figure 2.2, the project staff identified variables related to the issue areas and developed questionnaire items for the respondent groups. relationship of questionnaire items, to variables and issue areas is shown in figure 2.3. Copies of the questionnaires are located in Appendix B.

The second phase of the instrument development focused on the construction of the questionnaries. Project staff developed the format and questionnaire items of a first draft of each of the eight questionnaires and sent these to consultants for review. This process was repeated five times for the revision of the questionnaires before the final versions found in Appendix B we're adopted. Consultants knowledgeable in instrument development and the subject matter areas (e.g., vocational-technical education, job placement, career counseling, labor economics) critiqued the various versions of the questionnaires.

Downie (1967) indicated a major techniques used in determining face validity of questionnaires, is the use of a group of judges knowledgeable in the substantive areas. For this study these areas included vocational-technical education, labor economics, evaluation research, measurement theory; and thorough exploration of the available literature on factors affecting job placement such as job search, education, community, labor market, and s. forth. The items were constructed to reflect the meaning associated with each dimension and subdimension of job placement in related fields of training. However, as stated by Carmine and Zeller (1980),

....in measuring most concepts in the social sciences it is impossible to sample content. Rather, one formulates a set of items that is intended to reflect the content of a given theoretical concept. Without a random sampling of content, however, it is impossible to insure the representativeness of the particular items (p.22).

Moreover, in content validity, as Cronbach and Meehl (1955) observe, the "acceptance of the universe of content as defining the variable to be measured is essential" (p.282). Further they add:

However easy this may be to achieve with regard to reading and arithmetic tests it has proved to be exceedingly difficult with respect to measures of the more abstract phenomena that tend to characterize the social sciences (p. 282).

Additionally, Nunnally (1967) states that, "Inevitably content validity rests mainly on appeals to reason regarding the adequacy with which the content has been cast in the form of test items" (p. 93). In summary, in the development of the questionnaires the reviews of individuals' knowledgeable in the substantive areas was the primary method for addressing the validity of the questionnaires used in this study, along with the examination of information from the literature review.

The third phase of the instrument development process involved the pilot testing of the questionnaires. Questionnaires for each respondent group were piloted with less than nine individuals (federal government requirement) representative of each group. The results of the pilot test were used to revise the questionnaires and to assist in determining the time required to complete the questionnaires. Prior to adoption of the finalized questionnaires, reviews were made by nonproject staff from the National Center and reviewers from outside the National Center.

The fourth and final phase of the instrument development involved submitting the questionnaires to the Federal Education Data Acquisition Committee (FEDAC) for official government approval. The instruments were approved by FEDAC and assigned FEDAC Number S 208 with an expiration date of October 1981.

After the questionnaires were approved by FEDAC, they were considered ready for mailing to potential respondents.

<u>Pata collection</u>. The first mailing of the questionnaires to respondent groups contained a cover letter, the questionnaire, and a stamped, self-addressed return envelope. A project staff

member carefully monitored the questionnaire returns and checked off each respondent's individual code number. Four weeks later a second mailing was sent to the nonrespondents. This mailing contained a cover letter, the questionnaire, and a stamped, self-addressed return envelope.

Data handling and storage. Coding of variables such as occupation was done manually. One project staff member was assigned the task of coding occupations using the Dictionary of Occupational Titles coding scheme. Two-digit codes were used for this purpose. Interrater reliability checks were made by using other project staff members as coders and comparisons were made with sufficient evidence to support the reliability of the coding scheme.

Editing. Compilation of all data required a number of editing procedures. Occasionally, respondents would write in unrelated comments, which, upon preliminary screening were eliminated from the data file. Fortunately, these were very few in number. A project staff member responsible for the preparation of the returned questionnaire for keypunching visually examined the questionnaire to address concerns of reliability and validity of the data. Coding checks were made visually. After keypunching from the questionnaire to computer cards was completed, another check was made to verify the keypunching process.

Another editing phase used to ensure the accuracy of the data was the development of a computer program used to identify any inaccurately punched data. The program was developed for editing purposes by checking the values of the computer tape to assure they were legitimate values. For example, when certain questions required a Likert scale rating of 1 to 5, the legitimate codes of 1, 2, 3, 4, 5 were tested for by the editing program. Other codes such as 6, 8, 0, A, C, and so forth, were noted on a printout so that proper corrections could be made.

In summary, the editing procedures were included to address concerns for the reliability and validity of the data from the usable questionnaires.

Data storage and analysis procedures. The data were stored on computer tape to facilitate data analysis requirements. Every attempt was made to safeguard the loss of data and the confidentiality of the data set. This was addressed by limiting the work with the tapes to the computer and project staff personnel. To safeguard the loss of the data, duplicate tapes and punched card decks were maintained in a restricted storage area.

The data analysis was conducted by the researchers using The Ohio State University's computer facilities. The primary system of computer programs used for the analysis of data was the Statistical Package for the Social Sciences (SPSS). This package is

defined as a system which provides the user with a comprehensive set of procedures for data transformation and file manipulation, and offers a large number of statistical routines commonly used in the social sciences.

Arrangements for confidentiality of data. The project staff followed a number of procedures to ensure confidentiality for respondents, and to ensure that no unauthorized use was made of the collected information. Specifically, the following steps were taken to address this vital part of the study. First, the respondent's name did not appear on the data collection instrument. Rather, a separate code was assigned for the identification of the following pieces of information:

- o State ir ich the respondent resided/worked
- O Questionnaire type (e.g., was respondent a vocationaltechnical education teacher, a former student, etc.)
- o Postsecondary institution district in which respondent resided or worked
- o Postsecondary institution in which respondent worked or participtated in curricular activities
- o Identification code of respondent for mail purposes and follow-up mailing purposes

Second, safeguard procedures involved processing the data at the National Center by project staff members. For the third procedure, only one person was responsible for the maintenance of a master list of respondents' names and addresses. All master lists were destroyed following the completion of data collection The fourth safeguard procedure involved the destroying or securing of all completed questionnaires upon completion of the project and sponsor approval. Further, the conduct of this study did not constitute a system of records as defined under the Family Education Rights and Privacy Act (P.L. 93-380) and the There were no "sensitive" questions Privacy Act (P.L. 93-579). in the questionnaires. However, there was a section on "background information". These questions requested information from certain respondent groups on factors such as age, education aattainment, and work experiences. A number of previous studies relating to employment of youth reveal that background information is a significant factor. Moreover, these were considered essential items of background information to aid in assessing the contextual characteristics of study respondents' roles in the vocational-technical education program. No respondents' names nor their respective agency affiliation were reported. Re pondents were not forced to answer the questions if they did not desire to do so. Therefore, no confidentiality problems were presented by the inclusion of these items.

Finally, the study complies with the Freedom of Information Act (P.L. 89-554) within the limits of confidentiality noted above. Data in aggregated form will be made available in accordance with the Freedom of Information Act.

Data analysis procedures. As discussed previously, the unit of analysis was the postsecondary institution. The rationale for using the postsecondary institution as the unit of analyses was based on the fact that the individual postsecondary institutions could provide only an average job placement rate for their respective postsecondary institution. Therefore, for each independent variable used in the analysis of the mail questionnaire data set, a mean was calculated based upon the responses of the various groups comprising the sample of each postsecondary institution. The limitations of the use of aggregate data have been well documented under the concept of "ecological fallacy". Robinson (1950) cautions the researcher regarding the interpretation of individual-level variables based on the analyses of data aggregated by geographical or other units. Moreover, Borgatta and Jackson (1980) indicate that this interpretation leads to the assumption that because the use of ${}^{\lozenge}$ aggregated data could be misleading at the individual level, every such interpretation of the analysis of aggregate data had to be incorrect. However, they state that, while always suspect, aggregate data can possibly suggest findings that exist at the individual level. In addition, Borgatta and Jackson state that a particular brand of reductionism is required to attribute some characteristics associated with geographical and other aggregation limits to individuals. In this project, the interpretation of this reductionism was approached by using the four study methods: review of literature, analysis of existing data bases, case studies, and mail questionnaires. Guided by the study objectives and the resulting research questions (refer to chapter 1), simple descriptive statistics were prepared for describing the characteristics of the respondent groups and the variables under study. Moreover, to show simple relationships between two variables a two-variable frequency table or cross-tabulation was developed. Initially, these tables were developed to provide a basis for testing or presenting assumptions about variable relationships.

Measures of association were used to analyze certain variables. Zero-order correlations were used to define the degree of relationship. Also, the scattergram technique was used to provide a definition of the relationship as linear of curvilinear, along with the degree of association between the two variables.

To slow the joint or cumulative affect of two or more explanatory variables on the dependent variable, rate of job placement in related field of training, multiple regression analysis (MRA) and discriminant analysis (DA) were used. These techniques were used as descriptive tools in an exploratory mode to provide

definitions of potential hypotheses for future study on the separate and combined influence of the explanatory variables. Stepwise procedures which contained only those independent variables that made a significant contribution to explaining the variable were used in both the MRA and DA procedures.

Multiple linear regression was selected as a method of analysis to identify the best sets of independent variables that could be used to explain the variance in the dependent variable (the rate of job placement in related field). The multiple regression model focusing on the job placement in related field was the general form:

$$Y_1 = a + b_1 x_1 + b_2 x_2 \dots b_m x_n + e$$
 /

where Y is the dependent variable representing the percentage of former vocational-technical education students who completed their vocational-technical education program and were employed in a job related to their training (former students, class of 1978-79); \mathbf{x}_1 through \mathbf{x}_n are independent variables representing categories of variables including: (1) background information on the respondents, (2) information about the job placement process, (3) information about the instructional process, and (4) opinions about vocational education.

In this regression analysis, the independent variables were introduced into the equation by a forward (stepwise) inclusion method only if they met certain statistical criteria. The order of inclusion was determined by the zero-order correlations with the dependent variable, the degree of association with the dependent variable determined in the analysis of the other data bases, and the importance of the educational variables relating to whether the postsecondary institution could influence or control the particular variable. The central determination of influence or control was made by consulting with various groups and by using information from the review of literature by the project staff. (Refer to Appendix A for a list of persons from which information was obtained.)

Separate regression analyses were done for the following respondent groups:

- 1. Directors, teachers, counselors, and job placement specialists (school personnel)
- Current students
- 3. Former students
- 4. Vocational education advisory committee members
- 5. Employers of former students

3.4

Discriminant analysis was used as a statistical technique for studying the differences between the high placement sites (sixteen) and the low placement sites (fifteen) with respect to several variables simultaneously. For the purposes of this exploratory study, attempts were made to determine how well certain variables discriminate between the high placement postsecondary institutions and low placement postsecondary institutions and which variables are the most powerful discriminators.

The designation of high and low labor demand areas was based on the Federal and individual state departments of labor estimates of the 1979 annual average adjusted civilian labor force unemployment rate for the particular labor market area in which the postsecondary institution existed.

The iteration or data reduction techniques discussed earlier include a heuristic framework, a review of literature, discussions with a group of consultants familiar with the school-to-work transition, preliminary analysis of data using correlati mal techniques on existing data bases, and information obtained from the case studies. The analysis of those data provided the basis for the design of the discriminant analysis study.

Klecka (1980) states that the mathematical objective of discriminant analysis is to weight and linearly combine the discriminating variables in some manner so that groups are forced to be as statistically distinct as possible. The major mathematical assumptions for the use of discriminant analysis are that discriminating variables have multivariate normal distribution and that they have equal variance-covariance matrices within each group. Moreover, the assumptions required of discriminant function analysis are similar to multiple regression.

One of the regression and discriminant analysis assumptions focuses on the requirement for the absence of perfect multicollinearity. High multicollinearity (.8 or larger), can create serious estimation problems because, according to Lewis-Beck (1980), it produces large variances for the slope estimates and, consequently, large standard errors. Zero-order correlations among all variables used in the discriminant and regression analyses were computed. Examination of the intercorrelations showed that they ranged from .80 to -.60 (current students); .89 to -.66 (former students); .91 to -.65 (current and former students); .74 to -.83 (school personnel); .56 to -.61 (employers); .89 to -.88 (teachers); and .86 to -.68 (employers and advisory council members). Lewis-Beck (1980) indicates that while this approach is suggestive, a preferred approach is to regress each independent variable on all the other independent variables, and when any of the R^2 values from the equation is near 1.0, there is high multicollinearity.

Where multicollinearity was extreme, the independent variables in question were examined for their relationship with the dependent variable. In each case where the independent variable was the nonsignificant, that variable was excluded from further analysis.

The standardized Beta represents the amount of units of the independent variable which are uniquely associated with the percentage of job placement in related field of training with the effect of all of the other independent variables partialled out. Because the measurement units of various independent variables in a number of cases were not comparable, standardized or Beta coefficients were used. Moreover, Ezekiel and Fox (1967) state that for comparisons between problems where the standard deviations are much different, the Beta coefficient may have value.

The significance of the Beta was tested with an F statistic which generally should be at least four. Bowen and Weisberg (1980) state that this rule of thumb is actually very close for regressions with at least sixty cases. They add that if a coefficient is not significantly different from zero, then that variable can safely be dropped from the regression.

Multiple regression analysis is based on minimizing the sum of squares within any one group, whereas discriminant function analysis is based on minimizing the ratio or sum of squares between groups to sum of squares within groups. Klecka (1980) explains further the similarities and differences between multiple regression and discriminant analysis. He states that if a research situation defines the group categories as dependent upon the discriminating variables, then that situation is analogous to multiple regression. In discriminant analysis the groups are not defined as either the dependent or independent variable, and the same applies to the discriminating variables.

In the presentation of discriminant analysis by respondent groups in Chapter 3 attention is focused on the contributions of the individual variables to describe the relative importance of a variable in determining the discriminant score. Because there is variation in the scaling of variables; the standardized coefficients were examined. Simply put, the magnitude of the standardized coefficients was examined, ignoring the sign, to determine the variables' absolute contribution in discriminating between the high and low placement sites. Another statistic to be presented will be the eigenvalue. Klecka (1980) states that the size of the eigenvalue is related to the discriminting power of that function; that is, the larger the eigenvalue, the greater the discrimination. The canonical correlation, which is used in judging the substantive utility of the discriminant function is also presented in Chapter 3. A high coefficient indicates that a strong relationship exists between the groups and the

discriminant function. If the high and low placement groups are not different on the variables being analyzed, then the correlation will be low, because one cannot-create discrimination The fourth statistic is the overall Wilkes when none exists. Lambda. Wilkes Lambda is a multivariate measure of group differences over the discriminating variables. The values of Lambda which are near zero denote high discrimination. The final measure to be presented is the classification function, in which the discriminating variables are used to predict the group to which a case most likely belongs. However, since we are dealing only with the high and low placement groups, we can expect 50 percent of the predictions to be correctly classified by chance alone. Klecka recommends that a proportional reduction in error statistic, tau, be used to give a standardized measure of, improvement irrespective of the number of groups:

$$n_{C} - \sum_{i=1}^{g} p_{i}n_{i}$$
tau =
$$n - \sum_{i=1}^{g} p_{i}n_{i}$$

n_c = number of cases correctly classified.
p_i = prior probability of group membership.
n. = total number of cases classified

A number of assumptions are identified when using discriminant function analysis. Assumptions identified by Klecka (1980) include the following: 4

- o Two or more groups
- o At least two cases per group
- o Any number of discriminatory variables, provided that they are less than the total number of cases minus two discriminating variables measured at the interval level.
- o No discriminating variable may be a linear combination of other discriminating variables.
- o The covariance matrices for each group must be (approximately) equal, unless special formulas are used. Each group has been drawn from a population with a multivariate normal distribution on the discriminating variables.

Klecka states that the requirements for multivariate normal distribution on the discriminating variables and equal group covariance matrices are the most difficult assumptions to satisfy. However, he cites Lachenbruch (1975) as having shown that

discriminant analysis is a rather robust technique which can tolerate some deviation from the multivarate distribution and equal group covariances assumptions.

Summary. This study involved the use of three research approaches: (1) literature reviews, (2) case studies, and (3) mail questionnaires. These approaches were chosen in order to produce a mixture of qualitative and quantitative data. The use of multiple data sets provided an opportunity for checking the reliability of the findings from the three approaches. Data patterns which emerged from more than one of the study approaches were presented to provide more reliable information.

The sets of quantitative and qualitative data used for the analysis were as follows:

- 1. Review of literature rele ant to the placement of former postsecondary vocational-technical education students in jobs related to their training.
- 2. Case studies conducted by two researchers for two weeks at four sites in four states. Data were collected from documents, observations, and in-depth interviews with administrators, vocational-technical education teachers, job rlacement specialists, guidance counselors, employers, advisory council members, current students, former students, and key community members.
- 3. Mail questionnaires received from respondents at thirtyone sites in the same four states. The respondents were
 vocational-technical education directors/deans,
 vocational-technical education teachers, job placement
 specialists, guidance counselors, employers, advisory
 committee members, current students, and former
 students.

Factors appearing to relate to high or low job placement from each set of data were incorporated in the report. These sets of data initially were analyzed independently to identify factors relevant to the job placement of former postsecondary vocational-technical education students. When cross-analyzed the findings from the three data sets did not always concur. These discrepancies are indicated in the report.

For vocational-technical education, this report represents a bold and somewhat nontraditional approach to data exploration and analysis. For the most part, vocational-technical education researchers and evaluators have relied upon the rationalistic paradigm to provide the basis for the inquiry mode. In this study, the data from the mail questionnaires and from the analysis of the existing data is representative of inquiry based on the rationalistic paradigm and the data collected in the case studies is representative of inquiry based on the naturalistic paradigm.

Numerous writers, including Pillemar and Light (1980) have noted that qualitative information enables the researcher to provide a thickness and richness of description that is nearly impossible to capture using only quantitative information. The case studies conducted as a part of this project have contributed to the depth of understanding of the factors relative to the placement of former students in jobs related to their training.

It was obvious from the framework guiding the study that the number of factors affecting job placement could be limitless. It was also readily apparent that vocational-technical educators can have very limited to no control over many of the factors affecting job placement in the labor market. Most of the study effort was concentrated on factors the National Center staff believed could be manipulated by vocational-technical educators. The primary focus for the data analysis was determining the relationship of these factors to job placement rates and the cc parison of high job placement sites with low job placement sites. Minor data analysis was conducted by using the sampling stitification variables of labor market demand or community type.

Sampling Plan

A nonprobability sampling design was used in this study. The major disadvantage of this design is that no valid estimate of the risks of error can be obtained (Blalock, 1979). However, because this was an exploratory study in which the main goal was to obtain valuable insights that ultimately may lead to testable hypotheses, the nonprobability sampling design was deemed appropriate (Blalock, 1979; Ackoff, 1962, and Kish, 1965).

The first stage of sampling involved the initial selection of states to participate in the study. Judgment sampling was used to select four states to be included in the study. The criteria used in this selection process included the following:

- The presence of an operating management information system in the state
- The willingness of states to participate in the study
- 3. A geographic distribution of states
- 4. A strong statewide commitment for providing postsecondary vocational-technical education programs

5. Consideration of project constraints such as level of funds, staff, and time

Based on these criteria, four states were selected and subsequently agreed to participate in the study. All individuals contacted were promised confidentiality regarding the identification of their names and the names of their participating state, postsecondary institution, and individual respondents at all sites.

The second sampling stage involved the selection of postsecondary institutions to serve as sites for the mail questionnaire part of the study. The population from which institutions were selected to participate was composed of postsecondary institutions offering vocational-technical education programs in at least five different occupational fields as defined by the six-digit USED code number. This criterion was based upon the definition of vocational education used in P.L. 94-482, Section 195.

The postsecondary institutions in each state were then stratified on the basis of two major variables:

- 1. Average job placement rate of the postsecondary institution (high or low). By establishing a median split of existing job placement
 rates by State, "high" placement sites and
 "low" placement sites were identified. The
 job placement rate was obtained from the
 individual state or local management information system records for the school year
 1978-79.
- 2. Labor market demand (high or low). High labor market demand was defined as having unemployment rates of 5.9 percent and below. Low labor market demand was defined as having unemployment rates of 6.0 percent and above. These data were obtained from records of the U.S. Department of Labor and the respective labor statistics office in each state (annual average 1979 unemployment rate). The classification scheme, shown figure 2.4, was adapted from the U.S. Department of Labor's classification system for labor supply.

FIGURE 2.4

LABOR MARKET DEMAND CLASSIFICATION

Labor Market Demand Designation	Labor Supply Category	Description	Unemployment Rate*
High	Group A	Overall labor shortage	>1.5%
High	Group B	Low unemployment	1.5% to 2.9%
High	Group C	Moderate unemployment	3.0% to 5.9%
Low	Group D	Substantial unemployment	6.0% to 8.9%
Low	Group E	Substantial unemployment	9.0% to 11.9%
Low	Group F	Substantial unemployment	12.0% or more

SOURCE: U.S. Department of Labor, Area Trends in Employment and Unemployment. July-December, 1979, pp. 30-31.

The combination of two levels of labor market demand (high, low), and two levels of job placement rates (high, low) resulted in a 2 x 2 design with four cells as shown in figure 2.5. The stratification was done in order to ensure that communities of differing sizes having different labor market demands would be included in the study. In addition, stratification allowed the researchers to explore job placement in specific subdomains of the population of postsecondary institutions, for example, among those postsecondary institutions in metropolitan areas having low labor demand,

^{*} Ratio of unemployment to area's total labor force.

FIGURE 2.5

POSTSECONDARY INSTITUTION SELECTION MATRIX

JOB PLACEMENT IN RELATED FIELD

			High	Low	
LABOR MARKET DEMAND	•	High	8 PSIs	·8PSIs	
	ن • •	Lʻow	8 PSIs	7PSIs*	

* One site from the original sample withdrew from the study.

The third stage of sampling involved the identification of sites for the questionnaire phase of the study. Thirty-two postsecondary institutions were randomly selected to serve as questionnaire sites. Because of the contraints of time and money, the number of postsecondary institutions was limited to thirty-two. To ensure representation in all cells of the matrix, a requirement of randomly selecting eight postsecondary institutions per cell was made. Ultimately, thirty-one of the thirty-two selected sites agreed to participate in the mail questionnaire phase of the study. The one nonparticipating site had originally agreed to participate in the study, but then withdrew. When the one site withdrew, insufficient time remained in the study to select an additional site.

The fourth sampling stage consisted of selecting the individuals to receive the mail questionnaires. Based upon the review of the literature and meetings with external project consultants (see Appendix A for a list of consultants), eight groups of respondents were identified: postsecondary vocational—technical education deans/directors, postsecondary vocational—technical education teachers, postsecondary guidance counselors, postsecondary job placement specialists, advisory committee members, employers, current vocational—technical education students, and former vocational—technical education students. These respondent groups were chosen because each is directly involved in the job placement of vocational education students.

Because five of these groups were relatively small in size, all of their members were included in the survey. These five groups were: vocational-technical education deans or directors,

teachers, counselors, job placement specialists, and advisory committee members. Due to the larger size of the remaining three groups (employers, current students, and former students) random sampling was required. Current and former students were systematically sampled from enrollment lists provided by the postsecondary institutions' student accounting systems for the school years 1979-1980 and 1978-1979 respectively. The sample of employers was randomly selected from lists of employers provided by the postsecondary institutions. The employers on the lists were known to have hired former vocational-technical education students.

For the case study phase of the project, one institution was/ selected in each of the four states. These selections were based on the judgment of the study staff working with state liaison personnel. The case study sites represented high and low job placement sites. Two of the study sites were very large and complex institutions. One of the institutions was located in the inner city. One institution was located in a small rural setting. Three of the institutions were community colleges and one was a postsecondary vocational-technical school.

CHAPTER III

FINDINGS

In this chapter information will be presented about the study sites, the respondents, and the findings concerning the relationship of labor market, community, and education factors to the placement of former postsecondary students in jobs related to their vocational-technical education experiences. The major portion of the chapter is organized by issue areas or themes that were identified initially or that emerged during the study. Due to the unique characteristics of each state, and the extreme variability of placement rates among the states, information within the issue areas or themes is presented by states. However, the four states were aggregated for the correlational regression and discriminant analysis. Due to the length and complexity of some tables, all tables are located in the appendices.

Information About Study Sites

Thirty-one postsecondary institutions (sites) located in four states were represented in the mail questionnaire part of the study. One of the sites in each state served in a dual role as a case study site as well as a mail questionnaire site. Procedures used to select the sites were described in chapter 2.

Job Placement Rates

The dependent variable for the study was the percentage of students who completed their vocational-technical education program in 1979, who were known to be available for work and were placed in full-time, training-related jobs within six months after leaving the program. As shown by the data in table 1, the range and median of placement rates differed for each state. In this study the rates were considered for area postsecondary technical schools in State A and for community colleges with vocational-technical education programs in States B, C, and D.

In State A, the placement rates for the area technical schools ranged from 89 to 100 percent, with a median of 96 percent. The job placement rates for the eight area technical schools participating in the study ranged from 90 to 99 percent.

⁴⁵ 67

Five of the schools with 96 and above percent placement rates were high placement sites whereas the three schools with less than 96 percent were low placement sites. The case study site in State A had a placement rate above the median and was considered a high placement site.

The fifty-one community colleges in State 3 reported a range of placement rates from 56 to 94 percent. The median was 83 percent. The range of placement rates for the eight mail questionnaire sites was 80 to 92 percent. Three of the colleges were high placement sites whereas five were low placement sites. The case study site in State B had a placement rate below the median and was considered a low placement site.

In State C the median was 68 percent for the 102 community colleges with a range of placement rates from 33 to 100 percent. The range of placement rates for the eight mail questionnaire sites was 44 to 95 percent. With a placement rate of 68 percent, the case study site in this state was a high placement site.

The median placement rate in State D was 55 percent for the sixteen community colleges. The placement rates ranged from 20 to 75 percent. The range of placement rates for the seven mail questionnaire sites was 42 to 73 percent. Five of the seven colleges participating in the study were high placement sites whereas two were low placement sites. The case study site was classified as a high placement site.

.The postsecondary intitutions' placement rates collected for the study had been officially reported to the four respective state agencies. At the case study sites, however, the placement rates were not readily known by the majority of school staff interviewed. At the case study site in State C for example, neither the job placement specialist nor the academic dean would estimate the rate of job placement. They explained that the range of rates varied widely among the twenty-eight day and twenty-five evening vocational-technical education programs. They believed, as did other staff interviewed, that the reported The director of vocational rates exceeded the actual rates. training for the area community colleges which included the case study site in State C said, "When we need to report placement. information we hire an official guesser to complete the reports." Interviewees at the other case study sites believed that reported. job placement rates were representative of job placement in their schools and were as accurate as possible given the varied student populations and current follow-up systems.

The follow-up system developed in State B was used at that state's case study site to provide detailed information about job placement. School staff interviewed at that site appeared satisfied that the job placement rates were realistic, reflecting the

information they received through informal channels. Notwithstanding the alleged accuracy or inaccuracy, the officially reported placement rates were determined to be the best source available for this study.

Postsecondary Institution Characteristics

Table 2 displays the 1979 enrollments of the schools in the study. The enrollment figures for the community colleges (States \$,C, and D) include all students, including vocational-technical, academic, and continuing education students. The number of students at the case study community colleges enrolled in vocational-technical education courses are shown in the last column of table 2.

'As the data in table 2 show, part-time enrollments exceeded full-time enrollments at nearly all the community colleges in the study. The vocational-technical education school enrollments ranged from 146 to 2,353 full-time students in State A, with 1,774 students at the case study site. In State B the range was from 194 to 7,893 total full-time students in the community colleges. There were 8,600 full-time and part-time students enrolled in vocational-technical education programs at the case study site, which had a total enrollment of 20,764. In State C the enrollments ranged from 637 to 6,519 full-time students and from 947 to 16,333 part time students. At the case study site there were 555 full-time students and 623 students in night programs in vocational-technical education programs. The enrollment range in State D, was 1,123 to 2,504 full-time and 1,128 to 4,345 part-time students. At the case study site there were 258 fulltime and part-time students enrolled in vocational-technical education programs.

The case studies provided additional descriptive information about four postsecondary institutions and the vocationaltechnical education programs. Various characteristics of the four case study institutions are presented in table 3. indicated in table 3, the four case study sites differed in the type of settings, number of students enrolled, and vocationaltechnical education programs offered. The education programs at case sites A and D were housed in single buildings that contained all of the services and programs offered by the school. Although all of the programs at case site A were vocational-technical, many of the vocational-technical programs at case site D were considered transfer "career" courses. At both case sites B and C, the vocational-technical programs were increasing in number and enrollments, and were housed in at least two buildings on a multibuilding campus. Case sice C had a very compact, inner-city setting, with numerous building levels along with connecting ramps for the physically handicapped. Case site B had an open, spacious campus, typical of a four-year college environment.

In State C the case study community college was located in the downtown area of a major metropolitan city. The college was one of several in the local community college district, which was organized as a single administrative unit. Admission was open to state residents who were high school graduates, holders of certificates of proficiency from an accredited high school, or transfer students from accredited postsecondary institutions. The student body was 53 percent white, 27 percent black, 13 percent Hispanic, and 7 percent other ethnic groups.

Case site D had open admissions to all state residents with a high school diploma or recognized equivalent. The student body was virtually all white with 60 percent female. Counselors said that "it has been regarded as a good transfer school." A follow-up of the mid-1970s students indicated that 63 percent ultimately received baccalaureate degrees, mostly from the numerous four-year institutions nearby. Former and current students viewed their education as an opportunity to explore careers. An administrator said that "we feel one of our biggest jobs is to offer retraining for jobs as needs change in this area." According to the college catalog, the career programs are designed to prepare students for employment in a variety of occupational fields and in some cases, to provide the foundation for transfer to a four-year baccalaureate program.

Lopulation Characteristics

Information was collected to describe the population in the communities in which the thirty-one postsecondary institutions were located. Data were collected about the population for the counties in which the institutions were located. Additional information was collected regarding the community sites of the four case study institutions.

Table 4 displays the 1970 and 1980 population, and the percentage of change in that decade. In three of the states (States B, C, and D) there was a greater increase in population during the 1970s at the low job placement sites than at the high job placement sites. In State A, there was a lower average increase in the population at the high job placement sites and a decrease in population at the one low job placement site. In State D, three of the four high job placement communities decreased in population. It appeared that the trend was for more population growth in low job placement communities than in high job placement communities.

The distribution by ethnic origin of the population in the study site counties is displayed in table 5. There did not appear to be any relationship between the percentage of minorities

in the population and the rate of job placement. At a number of sites in States B and C, a high percentage of the population was of Spanish origin. It was somewhat discernible that at least two sites (numbers 9 and 13) in the study had a "majority-minority" population. One site (number 2) in State A had a sizeable percentage (13 percent) of American Indians although at the remaining sites at least 94 percent of the population was white. At nine sites in States B, C, and D, the range in Black percent of the population was 11 percent to 22 percent of the total population.

A closer examination of the population characteristics of the case study sites shows approximately 98 percent of the population was white at case study site A (State A, 6). Interviewees described the population as strongly believing in the protestant work ethic. Interviewees also felt that the population was supportive of vocational-technical education, viewing it as providing opportunities for their children and fostering economic growth. Postsecondary vocational-technical education had a strong position in the community, due in part to the involvement of vocational educators in community activities and in the involvement of the public with the schools through advisory committees.

In State B the population of the case study site was 52 percent Hispanic and 39 percent white, with 8 percent black. There were indications of past and current tensions between the whites and Hispanics. Although historically whites dominated in positions of power and control in the city, more Hispanics had been assuming key positions in recent years. Blacks appeared to be discriminated against by both groups. A few months prior to the case study, a Hispanic businessman was elected chairperson of the board of trustees of the district community college. This shift in the balance of power caused concern and speculation in the community about the forthcoming policies and governance of the schools. The majority of the enrollment at the site school was Hispanic whereas the other school in the community college district had a 30 percent enrollment of blacks.

The census data showed that 15 percent of the population were Hispanics at the case study site in State C, but public officials explained that the illegal alien population was considerably higher but could not be officially tabulated. Members of the armed forces comprised almost 14 percent of the population sixteen years of age and older. Although this community had grown very rapidly during the past two decades, the political conservatism had been maintained. Most interviewees felt that the public was supportive of ocational-technical education, especially in community colleges, primarily because of concern about unemployment among young adults. Interviewees felt that the numerous postsecondary institutions in the community minimized the economic impact of any one institution, especially

the study site community college that was located in the inner city.

The population (20,000) of the rural town where the case study site (number 25) in State D was located had less than 170 minorities. The population was described by interviewees as conservative yet allowing for individualistic thinking, and as having a wealth of well-educated people working in small businesses and crafts along with hill people, factory workers and farmers. The surrounding region was described as a student enclave due to the tremendous growth of four-year colleges and universities during the past decade. Higher education was important as a way of life and as a major part of the economy. Interviewees felt, however, that postsecondary vocational-technical education was not highly regarded despite the high work ethic of the people in the region.

Economic Characteristics

Unemployment rates are displayed for the study sites in In each state, site schools selected to participate represented communities with high and low labor market demand. At the time of site selection in 1979, the national median rate of unemployment was 6.0 percent. Sites with unemployment rates of 5.9 percent and below were designated as low unemployment rate Sites with unemployment rates of 6.0 percent and above were high unemployment rate sites. As the data in table 6 show, in States B, C, and D the average rates of unemployment were higher for low placement site communities than for high job placement communities. In State A the average unemployment rate was slightly higher for high job placement communities. There appeared to be a trend toward higher unemployment in low job placement communities across all sites. There was a wide range in the unemployment rates however, which indicates that the trend was not consistent for all thirty one sites. In State A, for example one low job placement site had a low unemployment rate of 3.3 percent while at one high placement site the rate of unemployment was 7.5 percent.

The data in table 7 show the per capita income for the population residing in the immediate vicinity of the school. In States B, C, and D, the average per capita income of high job placement communities was higher than the average per capita income in the low job placement communities.

Analysis of Respondents

A detailed explanation of the selection of the postsecondary institutions is provided in Chapter 2. Briefly, thirty-two

schools, eight in each of four states, were initially identified and agreed to participate in the mail questionnaire phase of the study. One school subsequently withdrew from the study but was not replaced due to project administrative and resource constraints.

The data in table 8 indicate the number and percent of questionnaires mailed and returned. Twenty-four percent (2,599) of the total number (10,983) of questionnaires mailed to all sites were returned in time for analysis. The highest mean response rate was 30 percent from the state with the highest placement rate (State A). In all except State A there was a higher response rate from high placement sites than from low placement sites.

A further analysis of the respondents is presented in table The response rate for all states is shown by respondent types The greatest percentage of the mail questionnaires in table 9. was sent to former and current students, with approximately 41 percent sent to former students and 25 percent sent to current Former students returned 24 percent and current students returned 22 percent of the mail questionnaires. comprised almost half of the respondents (former students 24 percent and current students 22 percent). Job placement specialsists received the smallest number of mail questionnaires (26 or .2 percent) with a 69 percent return rate. Deans/directors received 0.3 percent of the mail questionnaires with a 71 percent return rate. Approximately one-third (34 percent) of the vocational-technical teachers who received mail questionnaires (1,925) returned them, comprising 25 percent of the total returned from all groups. Almost half (45 percent) of the counselors who received the mail questionnaires returned them. Advisory committee members and employers received 7 and 8 percents and returned 42 and 37 percents respectively to comprise a fourth (25 percent) of the mail questionnaires received.

A further analysis by type of respondents is displayed in table 10. The information indicates how many individuals responded at the high and low placement sites in each state. The number of questionnaires mailed to the respondent groups depended upon the names drawn in the proportional sample. With the exception of job placement specialists, the numbers of respondents are representative of the sites. In State A there were no job placement specialists at the postsecondary institutions participating in the mail questionnaire.

At the case study sites, individuals were selected for interviews primarily through the cooperation of the state and local school liaison persons. Additional interviewees were selected as project staff identified key individuals at the schools and in the communities throughout the site visits. In table 11 ab analysis of interviews held at the case study sites

indicates that a total of 261 individuals were interviewed. A number of interviewees who were contacted more than once to provide additional information were counted once for the data displayed in table 11. The largest group interviewed, site school staff, included deans/directors, other administrators, job placement specialists, counselors and teachers. In order to maintain cooperation at the case study sites the Haison persons were encouraged to organize the interviews to be as unobtrusive to the regular school schedule as possible. One result of the cooperation displayed at one site in State D was the scheduling of group as well as individual interviews. The entire faculty of several departments met for group interviews. Several faculty members were interviewed individually as well. Similarly, students were scheduled for initial interviews in groups and when time permitted, were interviewed individually.

In several instances interviewees represented more than one role and were asked to discuss opinions from their various perspectives. For example, several part-time vocational-technical teachers were also employers or advisory council members. Frequently employers had been students at the postsecondary institutions.

Labor Market Factors

A number of labor market factors potentially contribute to the job placement of postsecondary vocational-technical education students. The majority of the interviewees at the case study as emphasized that the most important factor in job placement was the rate of employment in the community. A frequent explanation was "if you've got jobs, you'll have high job placement."

Closer examination of the impact of labor market demand upon the job placement of postsecondary vocational-technical students indicated that the average demand was not as salient as the demand for a specific type of occupation or technical skill. For example, whereas at case site B employers hired all of the computer technology students available, often prior to graduation, at case site C computer technology graduates found they would not be hired without previous experience. The average unemployment rate was, however, lower at site C than at the time of the case study visits at case site B.

In a study of secondary vocational education programs there was a higher rate of job placement reported for vocational programs in communities with a greater proportion of small businesses, (McKinney et al. 1981). This relationship did not appear to hold for the postsecondary site communities in the study.

The data reported in table 12 show the relative sizes of businesses in the mail questionnaire site communities. There appeared to be no distinct trend between the rate of placement

and relative sizes of industries. The averages indicated that there was more of a tendancy for proportionately larger businesses at high placement sites than at low placement sites.

Employers who responded to the mail questionnaire indicated the sizes and types of firms they represented. Table 13 provides an analysis of the sizes of the firms in terms of the numbers of employees. As the data in table 13 show, there was no consistent trend across high or low placement sites in the states. In State A the largest group of firms had between ten and ninety-nine employees in both high (41 percent) and low (33 percent) placement site communities. In State B, 36 percent of the firms at high placement sites had 100 to 499 employees and 34 percent of the low placement site firms had 10 to 99 employees. In State C there was a greater difference between sizes of firms in high and low placement site communities. Approximately half (51 percent) of the low placement site firms had 10 to 99 employees although the largest group (29 percent) of firms at high placement sites had 1000 to 2499 employees. In State D 42 percent of the high placement site firms had 10 to 99 employees compared to 36 percent having 100 to 499 employees at low placement site firms. These data indicate that the size of firms, at least in terms of members employed, did not appear to be associated with the job placement of postsecondary vocational-technical education students.

Employers who responded to the mail questionnaire also indentified the types of firms they represented. The data in table 14 show the distribution of types of firms represented by the respondent employers. Approximately 20 percent of the employers in both the high and low placement sites in State A indicated that they represented firms classified as service industries. Further, the employer respondent group indicated that 15 percent in the high placement sites and 13 percent in the low placement sites represented manufacturing industries. Of those employers in State A from retail trade industries, 15 percent were in high placement sites and 11 percent were in low placement sites.

Of the employers in high placement sites in State B who responded to the mail questionnaire approximately 31 percent represented manufacturing industries. In low placement communities approximately 19 perent of the employers were from manufacturing industries. Twelve percent of the respondents represented firms in retail trade in the low placement communities. This data suggest more diversity among the types of firms represented in the low placement communities of State B than in high placement communities.

In State C the employer respondent group indicated that retail trade, services and local/state government industries each represented 19 percent of the firms in high placement communities. In comparison, 29 percent of those responding in low

placement communities indicated they represented local and state government. Twenty-six percent of the employers in low placement sites did not identify their respective industry type.

In state D 29 percent of the firms represented by the respondents in high placement communities were classified as service industries and in low placement communities 24 percent of the respondents indicated that they represented manufacturing firms. For the high placement sites 29 percent of the respondents indicated that they represented other industries, and in the low placement sites 28 percent of the 75 respondents indicated that they represented other industries.

These results indicate a diversity of industrial types representing the thirty-one local public postsecondary sites. The crosstabular data suggest no distinctive pattern which would distinguish high placement sites from low placement sites. At the case study communities more specific types of firms were identified. Table 15 shows the specific types of firms in the communities where the four case studies were conducted.

Community Factors

The demographic and economic context of the study sites were described in previous portions of this report. The four case studies provided the opportunity to examine job placement in relation to the multitude of other phenomena in the communities. Table 16 provides a capsule overview of the context of the four case study sites.

As the information in table 16 shows, the case study sites were located in diverse types of communities. Case site A was located in a mid-sized city with an almost predominant white population. This contrasted sharply with case site B, which was located in a sprawling growing city with a majority-minority population. Case site C was located in the heart of a growing city with a 21 percent minority population along with uncounted numbers of illegal aliens. Case site D was located in a small, somewhat isolated town with less than 200 minorities. The minorities accounted for approximately 1 percnt of the population in case site D. This town, however, was the largest in the county and served as the county seat.

The interviews in case sites A and B viewed postsecondary vocational education as an integral and vital component of economic development of the communities. At case site B, the director of vocational-technical education was an active member of a well-organized and powerful economic development committee composed of community leaders.

In each case site the postsecondary institution occupied a unique position in its community relative to the other opportunities for postsecondary education. In sites A and D case site institutions were the only two-year public postsecondary institutions located in the respective communities. However, there were two or more four-year institutions located in or near the postsecondary institutions. In those communities (case sites B, C, and D) where many postsecondary education choices existed, the case study site postsecondary institution did not appear to be as important as in the communities with far fewer opportunities. the four case study sites, case site C had the greatest number and most diverse types of public postsecondary institutions in the immediate region. Although there was considerable economic development activity, the key officials in the city did not actively involve school personnel in case site C. Employers and others not directly associated with case site C pointed out that it was only one of many other public and private postsecondary institutions in the city. Administrators at case site C felt that the vocational-technical education programs were meeting employer needs in the community but also felt that their job placements did not have a major impact upon the labor market. appeared that higher education was an important enterprise in itself and a way of life in this community; that many persons took advantage of the numerous opportunities for education without specific career goals in mind; and that placement in related jobs was not the highest priority for the interviewees other than students.

Although case site D was the only two-year postsecondary institution in the community, graduates did not appear to have many opportunities for job placement. Interviewers said that the majority of the career programs are taught as transfer programs "especially since the job market simply doesn't exist here." According to the majority of interviewees, many who do find work in the area are underemployed or employed in a field unrelated to their training.

In contrast, most of the graduates of case site A, which was also the only two-year public postsecondary school in the community, found jobs. The community strongly supported vocational-technical education as evidenced by public expression of the value of the program and by the allocation of tax dollars.

Education Factors

Philosophical Positions

Information from review of literature. There was little pertinent literature about the philosophical position of postsecondary vocational-technical educators relative to placement in jobs related to their training. Cross (1081) conducted a study focusing on community college goals. Over eighteen hundred faculty members, administrators, trustees, students, and community members from eighteen geographically dispersed community colleges indicated their rankings of twenty possible goals for community college education. All of the respondent groups agreed that community colleges have a major obligation to provide vocational-technical education for students. Four of the five groups indicated that general education is the highest priority and vocational-technical preparation is the second highest priority from among the twenty goals. The fifth group, trustees, indicated that vocational-technical education is the highest priority goal for community college education.

Information from the case study sites. At the four case study sites interviewers' opinions regarding the importance of job placement as a goal of vocational-technical education ranged from regarding it the highest priority to not recognizing it as a responsibility of the postsecondary institution.

At case site A (designated a high placement site in State A) job placement appeared to be the highest priority goal of the The majority of the interviewees agreed that the interviewees. ultimate goal of the area vocational-technical school was to place students in jobs related to their training. Most interviewees also believed that the attainment of competencies was extremely important, especially since the vocational-technical education programs were based upon the mastering of occupational competencies. Case site A is located in a state that appears to value vocational-technical education. The state's fiscal manager for vocational-technical education said "education is a high priority for the state and for the people. The second largest expenditure of state funds is for vocational edugation in the state." Locally the employers stated, "the school is doing a good job of training," and "graduates of the school are very successful--vocational students are in high demand." The number of students participating in postsecondary vocational-technical education programs increased in 1979 despite the extensive declines in secondary school enrollments. The faculty handbook at case site A states that:

It is the intent that the vocational-technical program shall concern itself with the welfare and interests of the people of the area and

shall maintain close ties with those segments of activity contributing to increased quality of life and economic development of the area.

According to an administrator at the case site, "the school's reputation and the reputation of the instructors are major factors in the high job placement here." Employers agreed, as one stated, "the school's willingness to accommodate you to the best of their ability is noteworthy." The school's philosophy appeared to be one of responsiveness to the community's labor needs, along with emphasis upon high quality vocational-technical education and rigorous attempts to place all graduates of the programs. Interviews with teachers revealed that they understood that "placement is a part of my job" even though a job service counselor said:

Within my tenure here the economic factors are beginning to place a greater role in job placement than several years ago. As a result of the local market getting tighter, more attention is being paid to job placement outside the local area.

At case site B (designated a low placement site in State B) job placement was considered most important as the overall goal of the vocational-technical education programs. Several teachers said that placement was the ultimate test of their teaching and of the programs offered by the community college. The college president said:

The designed outcome is for a person to fit into the economic structure and placement attempts to see that it is brought about. I would assume that our success in technical education is measured almost entirely by whether or not we place people and whether or not they are well-trained people who can do the job when we place them.

The philosophy of the college, according to the president and the dean of technical education, is to meet the employer's needs for trained personnel and to provide high quality training for the students. With a shortage of skilled labor in the city, the students enrolled in training programs, especially electronics, data processing, and health fields, are hired prior to graduation and often without recognition of the job applicant's qualifications.

The director of counseling explained that job placement counseling is available for students but, "so many times the employers hire the students before they even get their associate

degrees" or the students work directly with the faculty to get placed. "In other words," he said, "the students are hired in many fields before they get out and it's just a matter of communicating to let them know which companies need someone." "I think," the director of counseling continued, "the teachers do a better job because they work directly with the community and because, after all, there's a limit to what a job placement officer can do."

An Hispanic city councilman who worked closely with the dean of technical education on the economic development council stated "I think the college has prepared people well—they have simply done a good job of building the city work force and I regard them as an integral part of our economic development program." He continued, "the college has a good deal of flexibility in their programs and they tend to be pretty responsive to market changes."

At the state level the commissioner of community college said, "Programs to be offered by the individual community colleges are a local option." However, the commissioner stressed:

The training received by students must not be too narrowly focused. Students must reserve enough broad training to be able to progress on the job. Narrow, specific training for local labor needs allows the individual to secure job entry but does not adequately prepare him or her for advancement on the job.

At case site C (designated a high placement site in State C) the community college administrators and teachers complied with the reporting requirements of the local district and the state. The district's chief administrator of vocational-technical education, stated:

The thrust in vocational education is realistic training for jobs that exist, essentially in the community. We are dealing with the real world. We want our programs to reflect the real world. So obviously placement is tied up right in the middle of all this. We look at programs that don't have a good placement rate and wonder why and how we can change it. Job placement is one of our top goals.

The case site administrators and teachers appeared to believe that placement rates were more influenced by the local economy than by their interventions. The director of placement said "the high placement in this area is because the demand is here. I think that's number one. Even if we can have the best program in

the world, if there are no jobs, then there are no placements." All teachers submitted monthly placement reports to the director of placement enumerating their students' job placements and starting hourly wages. Although the director of placement felt that "we all do placement," several teachers felt that the director received the "credit" for their placements and were less prone to make efforts to place students. A number of interviewees believed that job placement was a high priority for reporting purposes but not in reality. The director of placement explained:

The placement officer is the clearinghouse. I am the only professional here, and to be in charge of the myraid of things that I have to be in charge of, there's no way to deal with 12,000 students individually. As a result, everybody does job placement. I gave the instructors the credit because they're our pipeline.

At case site D (designated a high placement site in State D) several interviewees expressed surprise that job placement would be considered a function of a community college. Although there were sixteen vocational-technical education programs, most were taught as transfer programs. The majority of the teachers believed that there were few program-related jobs in the immediate community and did not see themselves as having many opportunities to place students. The college president stated:

I'm not sure per se the college has any obligation for placement--I'm not an employment agency, however, I feel we have a distinct obligation to keep in touch with the employers in the community and to communicate their needs to our curriculum, our faculty, and our students. We also inform the employers of the kind of careers we prepare the students for. But, in terms of finding the students a job, I'm sorry, but I don't think that's our function. In some cases, we have to tell them there are no jobs in this area in their field--that's a truth in selling that's very important--it's our obligation to tell them, they have a right to go somewhere else, but if they still want the courses, terrific, it's their choice!

Most of the students regarded the vocational-technical education programs as "an opportunity to explore careers." Most of the students were positive about their experience at the college, as one described:

I feel I've really blossomed here - I've gained a lot of self-confidence. In contrast to the state college I attended for a while, I feel like I've gotten a lot more direction here. The teachers have been really, really interested in my plans and have advised me accordingly.

Other students spoke about the personal attention they've received from faculty members. One student said "the teachers are so interested in the students."

Students were less optimistic about opportunities to find jobs and about the help the school could provide with job placement. One student said, "I think a lot of times this college is a resting place because of the job market." Another said, "I've heard of people using the placement office for transferring to other schools, but I've never heard of them going there for jobs." A teacher stated a commonly held feeling:

I feel quite guilty about my students because they're heading into careers where they'll find no fulfillment. I hear a lot of things about placement, but I have no evidence it exists except for placement in other colleges, as transfer students. I don't see the college committed to job placement at this time.

Most interviewees believed that the school provided an excellent foundation for transferring to one of the numerous four-year schools nearby but did little, due to the low labor demand, to encourage students to take jobs after receiving an associate degree.

As the case studies revealed, there were similarities and differences in the philosophies regarding job placement. Whereas at case site A the top priority was job placement to the extent of placing students in areas beyond the local labor market when necessary, at case site D the president did not believe job placement was a responsibility of the community college.

Information from the mail questionnaire. The respondents to the mail questionnaire indicated their priorities for vocational-technical education in the following question.

In your personal opinion, how should the following goals of vocational-technical education programs be ranked in importance?

(Rank the most important goal as 1, the next most important 2, the next most important 3, the next most important 4, and the least important 5.)

- To place students as they leave school in jobs related to their training
- b. To provide students with competencies needed to obtain jobs
- To place students as they leave school in jobs including nontraining-related jobs
- d. To create an awareness of the various jobs for which students might prepare
- e. To provide an opportunity for students to explore various occupational areas

The deans/directors, vocational-technical teachers, counselors, job placement specialists, advisory committee members, and employers who responded overwhelmingly agreed that their top priority was to provide students with competencies needed to obtain jobs. Responses are aggregated by state in table 17 to indicate goals considered most to least important for vocational-technical education programs.

As the data in table 17 indicate, 72 percent of the respondents felt that providing students with competencies needed to obtain jobs was the most important goal and 11 percent ranked it next most important. The second highest priority was the goal of placing students in related jobs, which was ranked most important by 8 percent and next most important by 37 percent of the respondents. The third highest priority, creating an awareness of jobs, was ranked most important by 10 percent and next most important by 29 percent of the respondents. The goal to provide opportunities to explore occupational areas was ranked most important by 6 percent and next important by 17 percent of the respondents. Finally, the goal to place students in unrelated jobs was ranked fifth with one percent of the respondents indicating it most important and 3 percent indicating it next most important.

The breakdown of the aggregate rankings indicated the differences in opinion among the various respondent groups in each of the four states. Table 17 shows the percentage ranked most important and the relative overall ranking indicated for each of the goals by the respondent groups and states. With the exception of advisory group members at low placement sites and employers at high placement sites in State A, all other respondent groups ranked providing students with competencies needed to obtain a job as the top priority goal. The advisory committee members at low placement sites and employers at high placement sites ranked awareness of occupation first. In State A the

teachers, counse ors at low placement sites, job placement specialists, and advisory council members at low placement sites ranked placing students in related jobs second.

In State B all respondent groups rated providing competencies needed to obtain a job as their top priority. A higher percentage of respondents ranked awareness of occupations second than they ranked placement in related jobs. Advisory committee members and employers ranked placement in related jobs third or fourth.

In State C all respondents except the job placement specialists and deans/directors at low placement sites ranked providing competencies needed to obtain a job first. Job placement specialists favored awareness of occupation, which was ranked second by several of the other respondent groups. Teachers and counselors at high placement sites, however, ranked placement in related jobs as their second highest priority.

With the exception of one dean/director at a low placement site and job placement specialists, State D respondents also ranked providing competencies necessary to obtain a job first. None of the respondent groups ranked placement in related jobs second, and only employers at low placement sites ranked it third. Rankings were mixed in this state, with teachers at high placement sites and counselors at low placement sites ranking placement in jobs not related to training second. Teachers at low placement sites and counselors at high placement sites and employers ranked opportunity to explore various jobs second whereas advisory council members ranked awareness of occupations second.

Despite the differences among various respondent groups in the four states, it was apparent that placement was not the highest priority. There appeared to be a trend for ranking placement in related jobs higher in the states with a high placement rate. In State A (median placement rate was 96 percent) the majority of respondents ranked placement in related jobs second whereas in State D (median placement rate was 55) that goal was ranked third by only one group and fourth or fifth by the remaining groups.

The data in table 18 show that the deans/directors assumed responsibility for identifying and critiquing the philosophy for vocational-technical education at the majority of sites. Over a third (eight 'to twenty-one) of the respondents did not know the locus of responsibility for identifying the philosophy. No trends emerged within the state due to the low number of deans/directors responding to the mail questionnaire.

The deans/directors also reported how often the philosophy for vocational-technical education was identified and critiqued. As indicated by the data in table 19, approximately 73 percent of the respondents reported that the philosophy is identified and

critiqued at least once every two years. There were no trends apparent differentiating high and low placement sites among the states.

Summary. Findings from the case study and the mail questionnaires revealed that positive philosophical positions regarding job placement are critical for high job placement. However, the majority of respondents did not believe job placement in related jobs is the highest priority for their institutions. Placement in jobs related to training was considered a higher priority in the state where the postsecondary institutions had higher job placement rates than in the other three states. When the respondents to the mail questionnaire in all states, were asked to rank goals for vocational-technical education in postsecondary institutions they overwhelming chose "to provide students with competencies needed to obtain jobs" as the most important goal for vocational-technical education.

At the postsecondary institutions with relatively high job placement rates the commitment of administrators, faculty, and other staff to job placement as one important goal of their vocational-technical program was evident. The commitment was apparent not only in the staff attitudes but in the level of resources alloted to promote job placement activities at the institution. The level of communication about job placement bc tween institution and labor market representatives was higher and more consistent at high job placement sites than at low job placement sites. Throughout the study it was evident that the most significant factor in the level of job placement at postsecondary institutions was the underlying philosophical position of administrators and the individual faculty members who did much of the actual job placment and the other staff members who provided essential support and informational services.

Program Planning

Information from review of literature. Planning of vocational education programs was explicitly emphasized in the Education Amendments of 1976 (P.L. 94-482). The law stated that plans for the use of federal funds must satisfy at least four requirements:

- Coordination and consultation with representatives from other education and training agencies in the service area
- Consultation with a local advisory council for vocational education
- 3. Assessment and evaluation of student needs

4. Explanation of how the vocational program plan meets identified student needs and the needs of the employers for skilled workers

In addition to meeting federal requirements for planning, Van Ausdle (1980) emphasized the "crucial need for two year colleges to strengthen their managerial capabilities" through planning due to the "unprecedented changes in societal trends which have created both threats and opportunities for the two-year college." According to Van Ausdle (1980) comprehensive program planning is best implemented in a step-by-step process that requires administrators to do the following:

- 1. Assess current and past conditions and the environment in which the institution operates
- 2. Assess the needs of present and future clientele and the societal needs for which the institution operates
- Define goals and set objectives based on the needs assessment
- 4. Determine and implement programs to achieve the objectives
- 5. Assess the progress toward achievement of objectives

Collection of data about students and the local labor market has become essential for comprehensive program planning and for meeting the requirements of the law. Rall and O'Brian (1977) stated:

When implementation of a new curriculum is being considered it is necessary to consult with representative employers of persons in order to be reasonably certain that jobs will become available. A review of national, regional, and state manpower projections may indicate broad trends—but more exact, local data are needed (p. 61).

No consistent mode of planning for vocational-technical education programs emerged from the analysis of interviews and documents at the four case study sites. A recent study by Starr et al (1981) similarly found the following:

- Relatively few schools have a long-range institutional plan for vocational education.
- o Long-range vocational education planning, when it does take place, occurs most often in conjunction with facility planning.

- The schools do engage in numerous vocational education planning activities. However, the planning that does take place is usually not found in a written planning document. As a consequence, the planning processes and procedures that do occur in local schools are seldom, or only partially, communicated to groups or individuals outside of the school.
- O Local applications for federal funds received at the state level from postsecondary schools seldom contain sufficient detail to serve as planning documents. Indeed, it is usually difficult to discern the extent or nature of local level planning simply by reviewing local applications.
- o larger postsecondary schools are more likely to have formalized planning processes and policies and are more likely to have the resources to employ staff who have expertise in planning or research. It is important to recognize that many schools offering vocational education do not employ persons with specific expertise in planning or research.
- O Decisions about vocational programs and services in many schools are often made by persons who are not vocational administrators. Planning decisions are often finalized by presidents of the postsecondary institution rather than by deans of occupational/vocational education.
- Some kinds of planning activities are more likely to occur on a regular basis; other kinds of planning activities are likely to occur sporadically. Monitoring and assessing enrollment levels and student interest in vocational programs, and determining costs and expenditures are examples of instructional program planning activities that are usually conducted on a regular basis. Planning instructional programs and services to meet the needs of special client groups (e.g., handicapped and disadvantaged) and to ensure equal access to vocational education by both seves are more likely to occur on an irregular basis and then usually on a "felt-need" or externally induced basis. Systematic planning that includes needs assessments as a basis for providing instruction and services to special client groups or to promote equal access is the exception rather than the rule (pp. 7-8).

Information from the case study sites. At the four case study sites administrators and teachers said that advisory committee input was used to some degree but no other processes were mentioned which were common across all sites. Student interests,

enrollment and follow-up data, teacher input, local labor market information, and state-level data were cited most frequently as sources of information for planning.

At case site A (designated a high placement site in State A) new programs were started based on employment needs of the community. These needs were determined by gathering employment projection information and from recommendations of the advisory council. According to the state plan

Area vocational-technical institute instructors shall be responsible for program planning, and that such responsibilities shall be directed toward a learning environment in which subject matter knowledge, occupational skills, and related attitudes are directed as needed in meeting a specific student identified occupational objective, so that such learning experiences provide the students with entry-level qualifications for defined employment.

Once a program is approved by the program advisory council it is sent to a general advisory committee made up of representatives from program advisory committees, students, former students, employers, and others. If this group approves the program is then presented to the school board for review. The school board will not approve or act on any vocational-technical education question until the position of the general advisory council is known. One instructor said,

A real battle is beginning to build between the postsecondary academic schools in the area, and the vocational school because the postsecondary academic school is starting to offer AA degrees that conflict with the area vocational-technical education programs.

The board for higher education has the responsibility to keep schools from duplicating efforts, but interviewees indicated the board has taken no action to control this problem so far.

At case site B (designated a low placement site in State B) vocational programs that are offered are based on priorities, desires, and needs of the local people...not the state people. As one state official said, "the community colleges in the state are 'locally automonous'." He further said:

while an area may seem to require trained persons in a specific field, unless the local board and advisory committees perceive the need because new jobs will be created then nobody wants to train somebody in these high

cost programs where they're going to go off to a nearby town instead of staying home to work. In this state community colleges, and not the state, have the last word.

A state education agency document includes the following principle of operation for program planning for postsecondary programs:

Each program of instruction must be designed to prepare individuals upon completion for employment in a specific occupation or cluster of closely related occupations in an occupational field, and must be particularly suited to the needs of those engaged in or preparing to engage in such occupation(s).

There is a general consensus that program planning is strongly influenced and often directed by input from the advisory committees. One advisory member indicated, We're able to tell them what we perceive as needed in the field; consequently, we prefer their students, in comparison to other institutions." Another advisory committee member stated that "our input is definitely used."

A mid-management faculty chairperson reports that substantial program changes, which deviate from what is offered in the catalogue must be approved by the academic council, chaired by the dean. Following approval by the academic council, changes must then be approved by the state education agency.

At case site C (designated a high placement site in State C) a new program must be approved by the community college board of trustees before it is sent to the state for their approval. The president reported that a new program is usually considered because of a recommendation from the business community. If the request for such a program is viable, a needs assessment of the community is conducted to see if the program is needed and wanted. The state plan in its guidelines for developing new education programs states that programs must show need in "relation of proposed program to job market analysis." When need is established, the instructor prepares a proposal and submits it to the president and board for approval. If they approve the program, then a curriculum is developed and both the proposal and curriculum are sent to the state department for approval.

The institution president reported "that programs are often started and then stopped depending on the continued need for them." He gave an example of a program, which had been cancelled recently because the graduates were not being paid anymore than if they had applied for the job without the further education. This was a program that the community had requested as being highly needed.

All persons interviewed agreed that teachers have the greatest involvement in changing programs at the college, but that this happens because of the labor demands of the area or the advisory council has stated a need for the change.

At case site D (designated a high placement site in State D) when a new program was being considered a proprosal is submitted to the president and executive committee of the community college for their approval. If in their opinion, the proposal has merit, it is then sent to the state community college board for its ap-This agency has a person assigned the responsibility for approving all requests for new programs for all the community colleges in the state and to make sure the requested program will not be a duplication of effort. This person decides whether the program should be approved based on labor market data showing a need for the program. If the community college board approves, the proposal is sent to the state governing board for higher education for their approval. If both agencies approve the request is sent to the vocational education division to request money to support the program. Although the state vocational education agency has the option of refusing the request, they have always accepted the recommendation of the governing board for higher education. Funds for new programs are allocated for a period of one to three years, after which the community college must have money within its own budget to maintain the program.

In reference to developing new programs one staff member indicated that the lack of funds was a reason for few new programs being initiated. The president responded, "That is a copout, that's not true, we're not restricted by budget at all. There hasn't been a fullfledged proposal submitted for a new program. I've heard that excuse too damn often."

Information from the mail questionnaires. In the responses to the mail questionnaire, half (eleven of twenty-two) of the deans/directors did not know who had primary responsibility for analyzing vocational-technical program objectives for their institutions. In table 20, the data indicate that in State A either the directors or teachers had the responsibility when a response other than don't know was given. In State B the respondents indicated that advisory committee members and directors had major responsibility for analyzing institutional objectives in the low placement site whereas the respondents were not sure who had such responsibility at the high placement site. Similarly in State C low placement site respondents indicated the state agency and dean/director had responsibility for analyzing program objectives whereas the three responses from the high placement sites did not know who had the responsibility. In State D, advisory committee members, and deans/directors had responsibility for anlayzing program objectives at high placement sites while the one response from a low placement site indicated that teachers had primary responsibility for analyzing program objectives.

In table 21 the data show how frequently deans/directors who responded to the mail questionnaire believed the program objectives were analyzed. The majority (sixteen of twenty-two) of the respondents indicated the objectives were analyzed at least once a year. The exceptions were in State B where two of the low placement site deans/directors indicated their institutional program objectives were analyzed every two years. In State C the respondents from low placement sites indicated that institutional program objectives were analyzed once every two years, once every four years and once every five years in addition to one respondent indicating at least once a year. In State D one dean/director indicated program objectives were analyzed once every two years whereas the other two deans/directors from high placement sites indicated that objectives were analyzed at least once a year.

Fifty percent of the deans/directors responding to the mail questionnaire indicated they held the responsibility for allocating funds for equipment and supplies for the vocationaltechnical education programs. As shown in table 22 in State A all of the three respondents from high placement sites indicated that the state agency allocated the funds whereas the low placement site response indicated that the director had the responsibility. The responses from the high placement sites in State B indicated the state agency and director had responsibility for allocating funds for equipment and supplies. Directors and the school research and evaluation division were reported as having responsibility for allocating funds for equipment and supplies in the low placement sites. In State C all respondents from the low placement sites indicated that the dean/director had responsibility for allocating funds for equipment and supplies whereas 66 percent of the responses from high placement sites showed that the responsibility rested with the state agency and advisory . In State D, 67 percent of respondents indicated that the dean/director and 33 percent indicated that the state agency was responsible for allocating funds for equipment and supplies. The one low placement site response indicated that the advisory committee had the responsibility to allocate funds for equipment and supplies for the programs.

Of the dean/directors who responded (22) to the mail questionnaire, 32 percent indicated that the advisory committee and 27 percent indicated that the state agency held primary responsibility for determining the supply of trained workers that employers will need. In table 23 the data show that the locus of responsibility for determining the need for trained workers varied among the sites in the study. In State A deans/directors of the three high placement sites indicated that the state agency, advisory committee and school research/evaluation unit

held primary responsibility for determining the supply of trained workers that employers will need whereas the deans/directors at the low placement site indicated that the advisory committee had the primary responsibility for determining the employment needs. The two responses from the deans/ directors in the high placement sites in State B indicated that the director and teacher had the responsibility for determining the supply of trained workers that employers will need whereas the deans/directors from the five low placement sites indicated that the state agency, advisory committee, director and teacher had the responsibility. deans/directors of two of the high placement sites indicated that the state agency had the responsibility for determining employer's need for trained workers whereas the one dean/director indicated that the teacher had this responsibility. sibility of the deans/directors from the four low placement sites were split between advisory committee and director. Deans/ directors of the the high placement sites indicated that the state agency, advisory committee and school evaluation/research unit had this responsibility in State D. In State D the deans/ directors at the low placement site response indicated that the state agency held the responsibility for determining the supply of trained workers needed by employers.

Employers who responded to the mail questionnaire indicated how often the schools contacted them to assess their skill needs (table 24) and also how often schools should contact them (table As shown by the data in table 24, the majority of schools either contacted the employers once a year (25-48 percent) or never (28-58 percent) contacted them. In State A there was less difference between high and low placement sites than in the other states in the frequency of contact. In State B there was a greater difference between high placement sites and low placement sites, with 31 percent of the employers from high placement sites and 46 percent of the employers from low placement sites reporting they are contacted once a year. Fifty-eight percent of the employers in high placement sites indicated the postsecondary institution never contacted them whereas in the low placement sites 37 percent never contacted them. In State C the responses from the high placement site employers indicated that 48 percent of them had been contacted once a year by the postsecondary institution to assess skill needs. Thirty four percent of the employers from low placement sites indicated they were contacted at least once a year. In State D fewer (25 percent) of the high placement site employers indicated they were contacted once a year by postsecondary institution personnel to assess skill needs as compared to 48 percent in the low placement sites. high placement sites 50 percent of the employers indicated they were never contacted as compared to 28 percent of the employers from low placement sites.

In table 25 employers' responses indicated how frequently they would prefer to be contacted by the schools for information

about skills needed in their businesses. As the data in table 25 show, the majority of employers (64 percent in low placement sites and 80 percent in high placement sites) in all states preferred to be contacted once a year. A small number of employers (4 percent in low placement sites and 24 percent in high placement sites) indicated that every two years would be preferable, but very few employers (0 percent in low placement sites and 6 percent in high placement sites) indicated that they should never be contacted by postsecondary institutions concerning their job skill needs. No clear trends emerged distinguishing employers at high placement sites from employers at low placement sites concerning the frequency with which the postsecondary institution should contact them concerning their job- skill needs.

Deans/directors responding to the mail questionaire indicated how frequently various methods were used by their schools to assess employers' skill needs. The responses indicated that various methods were used by all sites to assess the skill need: of employers. As the data in table 26 show, the majority of the deans/directors (twenty of twenty-two) indicated that the recommendations from advisory committees are used at least once a The other two deans/directors indicated that they used advisory committee recommendations once every two years. of the twenty-two dean/directors indicated that information from the Public Employment Service was used at least once a year, five dean/directors indicated every two years, and one dean/director indicated never. Written surveys were used once a year by nine of the dean/directors and once every two years by another nine, with one dean/director indicating written surveys were never used. Annual interviews of employers at their work sites were reported by ten deans/directors with three dean/directors reporting once every two years and three reporting that employers were nevel interviewed at the work sites. Telephone surveys of employers were conducted once a year at six sites, once every two years at eight sites and never at three of the sites.

Advisory committee members who responded to the mail questionnaire indicated how much help they provided in identifying new occupational areas for vocational-technical education program improvement. In table 27 the data show that few (3 to 13 percent) advisory committee members indicated that they provided very much help. The majority of the respondents from all four states reported that they provided some (23 to 50 percent) to much (16 to 36 percent) help in identifying new occupational areas.

Respondents to the mail questionnaire indicated whether they had received information concerning various studies conducted by the postsecondary institutions during the past five years. In table 28 the data show that the majority (67 to 100 percent) of the postsecondary institution staff in States A, B and D received

follow-up reports of former students. Postsecondary institution staff and advisory committee members from State C received less (20 to 100 percent) follow-up reports than did similar staff committee members in the other states. In all states deans/directors and job placement specialists received student follow-up information most consistently with no observable trends between high and low placement sites.

In table 28 the data also indicate whether respondents received two other reports, a survey to assess employers' job skills and labor requirements and a survey to assess employers' satisfaction with former students. Similar to the responses regarding follow-up reports, school staff indicated they received more information than aid advisory council members. The responses varied more among the respondent type than among the states. In all states the 100 percent response rate was for deans/ directors. Few of the counselors and job placement specialists in State C and D indicated that they received reports assessing employer needs and employer satisfaction with former students. The majority of teachers in States A, B and D received these reports, whereas a third of the teachers at high placement sites in . State C received the reports. In State A, 40 to 100 percent of the postsecondary institution staff and 33 to 56 percent of the advisory committee members received reports to assess employers' job skill requirements and employer's satisfaction with former students. In State B 40 to 100 percent of the school staff and 17 to 33 percent of the advisory committee members received them. In State C zero to 100 percent of the postsecondary institution staff and 32 to 67 percent of the advisory council members received the reports. In State D zero to 100 percent of the postsecondary institution staff and 26 to 49 percent of the advisory council members received the reports.

Summary. The postsecondary institutions in the study engaged in several program planning activities. However, systematic and comprehensive program planning was the exception rather than the rule at the study sites. Some planning activities occurred on a regular basis although others occurred sporadically.

It appeared that program planning in the high job placement sites was focused more clearly upon the needs of employers and the emerging trends in the labor market. Postsecondary institutions with high job placement rates worked more closely with business and industry leaders. Administrators and teachers at high placement sites made more frequent use of advisory committees in program planning. It was apparent that the postsecondary institution staff in high job placement sites more clearly understood the role of the postsecondary institution in economic development and worked more closely with business/industry leaders in program planning.

Business/Industry Involvement

Information from review of literature. "Programs of vocational-technical education must be an internal part of the community in which they exist and must reflect the day to day occupational life of the community" (American Vocational Association 1969). Educators have looked to industry for counsel regarding the development and content of vocational-technical education programs since their inception. The interdependence of industry and education was first recognized in the rules and regulations issued by the U.S. Department of Education in 1922 (Burt(1967). The desirability of involving industry in local vocationaltechnical education programs has been generally accepted by vocational-technical educators. A review of the literature indicates that one of the most effective formal means of obtaining the necessary cooperation between industry and education has been through advisory committees. Studies conducted throughout the past three decades show that vocationaltechnical teachers have provided more realistic and meaningful education when assisted by advisory groups.

Educators have had the burden of establishing the relationship with advisory groups. In a landmark study, Burt (1967) stated, "It is the quality of school leadership which is decisive in determining the nature and extent of industry cooperation. Advisory groups differ in their roles, fulfilling different necessary functions at state and local levels. Typically vocational-technical education programs have at least a general advisory committee (or council) and may also form departmental and specific occupation-advisory committees (American Vocational Association 1969). In this study the questions in the mail questionn e were oriented towards the general advisory commitcraditional role has been to assist in the developmaintenance of the entire vocational-technical education program of the institution. The general advisory committee draws members from across the occupational spectrum represented in the program and frequently from other concerned community groups. General advisory committees help identify the vocationaltechnical education needs of the individuals and the community; help access labor market requirements; help establish realistic, practical programs; participate in developing community support; help with developing long and short range goals for the program (American Vocational Association 1969).

Although advisory committees have provided the primary mode of cooperation and communication between the vocational-technical programs and industry, other types of relationships have been formed. These include cooperative education programs, contracted inservice programs, cooperatively developed job placement services, apprenticeship programs and private industry council (PIC) sponsored programs (Grede 1981).

A recent role for vocational education has been the concern for state level and local level economic development. Bruno and Wright (1980) have defined economic development as expansion of productive capacity through better management of the resources of labor, land, capital, or technology. According to a recent survey by the Joint Economic Committee (1979), the most significant factor contributing to economic development is the availability of skilled workers. The educational opportunities directed at maintaining and upgrading the productive capacity of workers figure prominently in business decisions to locate or expand operations.

Information from the case study sites. At case site A (designated a high placement site in State A) the attitude of employers toward the vocational-technical education school is very positive. All employers interviewed reported that they had attended open houses and tours at the school. Most of the businesses had tours for the vocational-technical education students. Employers stated that the contact they have with the vocational-technical education staff through civic, church, and other community involvement has a positive impact on the relationship they have with the school. Typical comments by employers in the area included: "With vocational graduates, we have very good luck"; "Graduates of vocational schools are very successful"; and "Vocational students are in high demand."

The good relationship between the vocational-technical school and business and industry may exist in part due to the stated mission of the school. The mission statement in the faculty handbook (1980-81) says:

It is the intent of this institution that the vocational-technical program shall concern itself with the welfare and interest of the people of the area and shall maintain close ties with those segments of activity contributing to an increase in the quality of life and economic development of the area.

The school has close ties with business and industry through its use of advisory committees.

At case site B (designated a low placement site in State B, a counselor stated that the plimary goal of the vocational—technical education programs is to graduate students with entry level skills for local industries. On the other hand, an employment commission spokesperson said that many employers are accustomed to the results of public education and "just won't use most of the graduates who can't even spell a simple word." A task force of business and education leaders concerned with promoting the city's growth pointed out that "there is a shortage of vocational—technical trained employees to meet the growing—business and industry demands."

7.4

The community college administrators appear to be in agreement about the need to serve the community through vocationaltechnical education to enable the population to meet current and future needs of business/industry, which is necessary for economic growth and stability. The key administrators are forwardlooking and proactive in their efforts, risking criticism to attract nontraditional clients to try innovative ways to reach client groups, and to influence business/industry to interact and depend upon employing graduates. The administration is well represented in formal committees and networks established within the college, with other educational institutions, and with the economic-political factions in the community. A large portion of the interaction is informal and based upon the good will established by persons dedicated to the role the community college has in the city as a vital growing city trying to meet the needs of \cdot its citizens through carefully plammed economic growth.

According to an article in the school newspaper, the recently appointed governing board will stress community involvement in the running of the college. One way that business and industry is involved is through the advisory council. A member of the state coordinating board said "The most useful advisory committees are specific to a program. They speak with more knowledge of business and industry/labor needs."

Although some negative remarks were made about the community college, the vast majority of interviewees praised the quality of vocational-technical education program. An excerpt from an employer's letter to one of the teachers was "Your school and program looks outstanding. Your reputation has reached beyond your immediate community."

At case site C (designated as a high placement site in State C) the director of training and vocational education stated in an advisory Committee booklet that,

The community college has a professional commitment to effectively and continuously utilize volunteer vocational education advisory committees. These committees must provide advisory direction to district coordinators, in an effort to assure a viable, up-to date vocational program -- a program that will provide students with adequate competencies and excellent opportunities for employment upon completion, in concert with the needs and desires of the business and industry of our city.

The community college has coordinators of vocational education that are responsible for continuous communication with the business and industry community. A district administrator

described the vocational coordinator's job as identifying with the community, and working with advisory committees. They are also responsible for talking to employers about the vocational students they have hired. The administrator described the coordinators as "public relations people; they are the eyes and ears of the community college." The district administrator explained that the school had at least one hundred advisory committees, each with at least ten members, which means "we can get in touch with over a thousand business/industry leaders in the community by picking up the phone."

The employers interviewed indicated that they have a close working relationship with school personnel, and particularly with the placement office director. They reported that they often hire vocational-technical education graduates rather than other applicants. One employer stated:

I think that the community college system here has done everything they can in the last four years to improve the quality of their students, as far as vocational education is concerned. They have kept very close touch with industry.

At case site D, designated a high placement site, one of the policies for the community college as stated by a state coordinating board representative is "to cooperate with government, industry, business, and service agencies in the provision of educational services to assist in solving problems related to the development of the Commonwealth's economy and its human and natural resources."

At the community college an administrator stated that the college faculty and staff are trying to get to the community through varied means, with representation on various committees in town, through service organizations and as elected officers in the community.

The president of the school indicated that not having enough staff limited the amount of contact they could have with business and industry.

Most interviewees had positive comments about what is happening, that the school is becoming more dynamic, more in tune with the needs of the community. However, some interviewers indicated there could be more effort made by the school to improve liaison with business and industry in order to develop entry-level positions. They said that efforts are being made, but they are scattered at this point. An example was the college-business community function held recently about which a typical comment was, "You know, its nice that we have the luncheon, but then what?"

. The placement director reported that he had made an effort to contact business and industry personnel in the area. He said, "I mailed letters to 125 prospective employers and only one responded out of the group. Not one person came... just one called." The letter asked employers about job openings, but also invited them to visit the school to see what they had to offer.

Information from the mail questionnaire. Advisory committee members who responded to the mail questionnaire indicated howlong they had served on their respective committees. The data in table 29 show that the most frequent response was that the member had served from two to three years. The exceptions included the 26 percent of the low placement site respondents in State A who served less than a year, the 33 percent of the high placement site respondents in State B who served six to nine years and the 27 percent of the low placement site respondents in State D who had served nine to more years.

As the data in table 30 indicate, advisory committee members reported that their committees typically met between once and twice a year. Few (8 percent or less) of the respondents never had committee eetings. In States A and D over a fourth (28 to 35 percent) of the committees met at least four times a year. The data did not indicate any trends between high and low placement sites in the number of times advisory committees meet.

Advisory committee members indicated how much help they provided in their role as committee members in sponsoring career days. In table 31 the data show that the majority of the advisory committee members in States A and B indicated they provided little to very little help in sponsoring career days. Approximately a third (32 percent) of the respondents from high placement sites in State C indicated they provided some help whereas over half (55 percent) indicated they provided little to very little help. Half (50 percent) of the State C respondents from low placement sites felt they provided very little help in sponsoring career days. State D respondents from high placement sites indicated they provided much to some help (72 percent) whereas those from low placement sites either provided some (26 percent) or very little (28 percent) help.

Advisory committee members indicated that they helped more in providing occupational information than in sponsoring career days. In table 32 the information shows that the majority of responding advisory committee members gave some to much help in providing occupational information. There were no trends between high and low placement sites in the amount of help respondents felt they gave in providing occupational information.

Advisory committee members indicated they provided less help in identifying tasks to be performed by workers than in providing

occupational information. As the data in table 33 shows, the highest percentage of respondents indicated they provided some help in identifying tasks. However, over a fourth (27 percent) of the advisory committee members at the high placement sites in State A indicated that they provided very little help in identifying tasks to be performed by workers. Several committee members in low placement sites in State C (30 percent) and State D (22 percent) also indicated they provided very little help in identifying tasks to be performed by workers.

The mail questionnaires also elicited information from em-Employers were primarily asked to indicate the frequency of contact with the school and who made the contacts. table 34 the data show that the majority of employers in State A and State D were contacted at least once a year regarding job openings for students. In State B 60 percent of the respondents in the high placement sites and 40 percent of the respondents in the low placement sites were never contacted. There was considerable difference in the frequency of contact between high and low placement sites in State C. Eighty-three percent of the employers at low placement sites were never contacted whereas over half (55 percent) of the employers at the high placement sites were contacted by the postsecondary institution regarding jobopenings for students.

The employers indicated that they should be contacted more often than they apparently were being contacted. The data in table 35 show that very few (9 percent or less) employers did not want to be contacted although approximately a fourth (24 to 34 percent) of the employers wanted to be contacted once a month by the postsecondary institution about job openings. The remaining employers wanted contact between at least once a year and four times a year. Employers from low placement sites indicated that they wanted more frequent contact than those from high placement sites.

The postsecondary institution personnel most likely to confact employers were job placement specialists or vocationaltechnical education teachers. Employers' responses to the mail questionnaire shown in table 36, indicated that they had few contacts from deans/directors or quidance ounselors regarding job openings for students. 'In State A, 50 percent of the employers from high placement sites indicated that the teachers contacted them and at low placement sites 31 percent were contacted by teachers and 42 percent by job placement specialists. In State B, employers at both high and low placement sites were more likely to be contacted by job placement specialists (33 and 42 percents) than by teachers (27 and 21 percents). In State C, 5 percent of the employers reported being contacted by teachers at high placement sites compared to 34 percent teacher contact at low placement sites. At the low placement sites in State D, 72 percent of the employers indicated that they were contacted by job

placement specialists compared to 8 percent by teachers. In the high placement sites in State D, the teachers made 38 percent of the contacts with employers and the job placement specialists made 25 percent of the contacts. The data in table 37 show that employers' responses were very similar regarding contact about skill needs. Employers indicated that the majority of the contacts regarding their skill needs came from teachers and job placement specialists at the postsecondary institutions.

Employers responding to the mail questionnaire reported the frequency of their participation in industry school staff exchanges and in career days. The data in table 38 indicate that the majority of employers never participated in industry-school staff exchanges. In State A a few employers 14 percent in high placement sites and 16 percent in low placement sites) indicated they participated in the exchanges very often whereas in the other states 2 percent of the employers in one high placement site indicated they participated very often. Employers indicated that they participated somewhat more frequently in career days as shown in table 39. In State A 56 percent of the employers in high placement sites rarely or never participated in career days whereas 64 percent of the low placement site employers participated sometimes to very often. In State B the majority (67 percent in high placement sites and 52 percent in low placement sites) of the respondents rarely or never participated in career In State C, 62 percent of the high placement site employers indicated that they were, often to very often whereas 57 percent of the low placement site employers indicated that they were rarely to never involved in career days. In State D 50 percent of the high placement site employers indicated they 'rarely' to 'never' participate in career days while 68 percent of the employers in low placement sites indicated that they participated in career days.

Employers responding to the mail questionnaire were asked if cheir business/industry has a union organization, and if a formal agreement for cooperation existed between the union's apprentice-ship program and the school's vocational-technical education programs? As the data in table 40 show, the majority (61 to 80 percent) of employers indicated that there was no union present in their business/industry. The exception was high placement site employers from State C who indicated that 38 percent had not union present. In all four states, very few employers (8 percent or less) indicated that such an agreement exists whereas 12 to 33 percent of the employers said that an agreement does not exist for cooperation between an apprenticeship program and the vocational-technical education programs, /

The teachers who responded to the mail questionnaire indicated how many employers they contacted in the past year about job openings for students. As the data in table 41 show, the majority of teachers (51 to 72 percent) contacted employers

from zero to five times during the past year. From 3 to 17 percent of the teachers indicated they contacted six to ten employers during that time. The percentage of responses between high and low placement sites were somewhat similar across the four states (64 to 82 percents) for zero to ten contacts.

In table 42 teachers indicated that many (41 to 60 percent) did not hold a second job in industry. Except for State C many teachers (42 to 55 percent) did not work during their semester off. However, many (45 to 75 percent) teachers did participate in inservice activities conducted by industry. Responses were similar between high and low placement sites within the states. Between 16 (State B, high placement) and 38 (State C, high placement) percent of the teachers held a second job in industry, while teaching. In State C a larger percentage of the teachers (48 percent in high placement sites and 42 percent in low placement sites) worked during their semester off from teaching when compared to the teachers in States A, B, and D.

Summary. Findings from the case studies and mail questionnaires indicated that the amount of involvement with business/
industry personnel varies among sites but tends to be greater at
the high placement sites. The quality of the involvement
emerged as a critical factor that was more apparent in the case,
study findings. The quality of the involvement of personnel from
business/industry was clearly viable in advisory committee
meetings. Where institutions had higher job placement rates the
advisory committee meetings were focused more specifically on
substantive issues concerned with program planning.

At the mail questionnaire sites "there were no consistent trends in high or low placement sites regarding the frequency or types of contacts employers and advisory committee members had with postsecondary institution staff. *Frequency of contact was moderate for the most part and less than employers felt was desirable. Teachers and job placement personnel tended to have more frequent contacts with business/industry personnel than didother postsecondary institution personnel.

Placement of students in jobs related to their training seemed to be enhanced when postsecondary institution personnel maintained consistent contact with business/industry personnel.

For example, at high placement sites teachers maintained ongoing commuication with employers and job placement specialists and administrators. At high placement sites, employers regarded the postsecondary insitution as highly responsive, eager to plan and participate in economic development and skill upgrading of current and potential employees. At high placement sites meeting with advisory committee members were productive with members input recorde and incorporated by school staff in planning and decision making.

Curriculum

Information from review of literature. Curriculm development focuses primarily on content and areas related to it. It represents a higher level of generalization than instructional development and always precedes it, (Kindred et al. 1976). According to Burt (1967) curriculum development is the "assembly of instructional units into courses of study and combining of courses into logical sequence (p. 153)." Burt (1967) explained that a number of factors complicate the process of curriculum development for vocational-technical education.

The curriculum must be designed to prepare students for entry into an occupation or cluster of occupations? A further complicating factor is that job entry requirements may be different for a variety of employers within the same industry, both locally and nationally (p. 153).

Job content, in terms of skill requirements, must also meet the current needs of the majority of the employers served by the educational enterprise. As Dauwalder (1961) stated regarding vocational-technical education curriculum:

Curricula must be developed among job requirements, skill requirements, technical and practical knowledge requirements, and must also maintain repeated education balance which is flexible and adjustable to changing conditions (p. 104).

Burt (1967) further explained that the curriculum must include courses to enable students to meet the graduation requirements of local and state education authorities as well as relevant accrediting and licensing agencies. For these reasons, business and industry representation is wital for carriculum development and revision. Kissinger (1965) described the key partners for curriculum planning as the employer, the technician, and the educator. Kissinger felt that each partner has a important role that cannot be overlooked. The employer knows what the graduate should know and be able to do. The technician knows what knowledge and skills are necessary to do the job. Kissinger (1965) indicates the educator must translate the employers and technician's advice to'a "series of learning experiences to which the student will be exposed, in other words, the curriculum (p. 31)."

Educators have the final responsibility for developing the curriculum. Beatty (1965) stated that a president described the curriculum development process at his technical institution as:

Most people from industry are not good curriculum developers. Each of them has his own problems associated with his own place of

business, and he would like to prepare people who would fit nicely into his organization. We listen attentively to all our industrial advisers, but we do not build our curriculum around exactly what they say. We take their ideas and we build the curriculum into an educational pattern which will meet their needs as well as the needs of companies not represented on the committee (p. 200).

Ultimately the success of a vocational-technical education curriculum is measured through the results of achievement that take the form of performance in the work world. Finch and Crunkilton (1979) notes that "a vocational-technical curriculum must be judged in terms of its former students' success (p. 10-11)." Although success standards vary among schools and states, they frequently reflect criteria such as employer satisfaction with graduates' skills, graduates' obtaining jobs in their fields of preparation, job satisfaction of graduates, and advancement experienced by graduates (Starr 1975).

Information from the case study sites. At the case study sites the curriculum for the various programs was primarily developed or changed by faculty members, often with input from vocational-technical education directors and advisory committee members. Procedures were not rigidly formalized, although there appeared to be a system at each site that resulted in revisions, additions or deletions from three months to a year later. Although interviewees were not always able to explain the reasons for the changes, it appeared that a combination of student interest/demand and local labor market needs were the underlying reasons. Most teachers and administrators also felt that there were state department and institutional pressure to update the curriculum for relevance and student appeal.

At case site A (designated a high placement site in State A) most programs of study were designed with an open-ended curriculum system. The curriculum was broken down into units called packets. Students progressed from packet to packet at their own speed.

Most teachers expressed support for the open-entry/open-exit vstem, but some had reservations. A few faculty members report-that the system was too demanding since each student was at a ferent place, and each needed individual attention. Other ulty stressed that the major strengths of the open-ended cur-culum overcame the bad aspects. They described the strengths as allowing, "students to work at their own pace," and "bright students could progress as rapidly as they wanted, whereas slower students could also move at their own rate." The teachers also indicated that this type (curriculum was more of a challange to them and to their students than the more traditional curriculum.

Faculty were relatively free to develop their own curriculum. The education exercy has mandated the topics that must be included in a program, but development of the actual curriculum content has been left to the teachers. When major curriculum changes have been planned, teachers have been required to clear these changes with the program's advisory committee. Coordinators for each program area, located in the local education governing board office, typically have had input into major curriculum changes.

At case site B (designated a low placement site in State B), each vocational program area has prepared a suggested sequence of courses leading to graduation. This sequence had been drawn up by faculty members with input from the program area advisory committee.

Some interviewees indicated that occasionally students have been denied lower-level vocational-technical education courses because of limited classroom, and/or laboratory space. These students have usually been advised to enroll in the courses when they are next offered, but there is no waiting list. According to, some faculty members, some students never take these programs because they fail to enroll in the class at a later date. Upper-level classes, however, which require prerequisite courses, have rarely been closed to eligible students.

Several different approaches to providing specialized training in job-seeking skills have been used. Some program areas, for example, child development, include a course in the curriculum focusing on employability skills. In one of the classes in the advertising art program, each student is required to assemble a "portfolio" for use in obtaining a job. Other programs rely upon one-day workshops conducted by counseling staff. In addition, instructors are encouraged to incorporate job-seeking training into their courses. Overall, it appeared that the curriculums include employability skills through a variety of modes to ensure that each student has skills to seek and obtain a job. All of the students interviewed related that they had received training in job-seeking skills.

In order to provide vocational-technical education program access to students who cannot attend classes during the day, the college offers an evening division, leading to the same degrees as the regular day programs. These programs are offered at twenty-four different locations throughout the city.

At case site C (designated a high placement site in State C) all persons interviewed agreed that the teachers have the greatest involvement in developing and changing curriculum. Curriculum has usually been changed because of the local labor demand or on the advice of the advisory council. There did not appear to be formalized procedures for changing the curriculum, which

seemed to be changed at the discretion of the Associate dean or teachers.

The college offers a wide variety of programs including twenty-four arts and sciences, eighteen business, and forty-one technical programs. The college has a career and educational planning center that is available to students to help them with resume writing, filling out job applications, job interviewing techniques, and information about how and where to look for jobs. These services are not part of any regular curriculum, but are available to students on a "drop-in" basis.

At case site D (designated a high placement site in State D) much of the vocational-technical education curriculum was characterized as being "white collar" by many of the students and staff members. According to a counselor, "many of the vocational technical couses are billed as 'terminal' with transfer possibilities." Full-time day students have typically pursued a program designed to culminate in an associate degree from one of the four divisions: behavioral science, business administration, human ities; and natural science.

Curriculum changes are mainly the responsibility of the faculty members. One teacher who had recently been involved in changing the curriculum explained the change as:

The director of this program who was here for the last two years had a particular interest in curriculum development. He worked with the faculty in developing the central framework and understanding the language of curriculum development. The curriculum we were using, we all liked, but it was felt that it could be communicated more effectively. Advisory council members, state board members, administration and faculty all worked together to come up with what is being used now.

Information from the mail questionnaires. In table 43 the deans/directors indicated that for the most part, the advisory committee members and deans/directors determined the specific competencies students should acquire. In the same table these data suggest that advisory committee members, deans/directors or teachers had a primary responsibility for developing and revising the vocational-technical education curriculum.

As shown in table 44 the deans/directors responding to the mail questionnaire reported that the curriculum was revised annually at most of their institutions. At the other institutions the curriculum was revised every two years, with the exception of a few institutions in State C where it was revised every four or five years.

Current and former students responding to the mail questionnaire indicated which skills were taught at their institutions.
Table 45 show that approximately half of the respondents felt
that training in job-seeking skills and job obtainment skills was
provided at their institutions. With one exception there did not
appear to be differences in opinion between current and former
students within the states. The exception was at high placement
sites in State C where 21 percent of the current students felt
they received training in job-seeking skills compared to 45
percent of the former students. In some states the high placement
sites indicated more availability of training whereas in others
the low placement sites indicated more.

Summary. Findings from the study indicated that curriculum which was designed to meet labor market needs of the community enhanced job placement. At sites where advisory committee input and other labor market information was used as the basis for curriculum changes the placement rates were higher. Employers at the high placement sites appeared to be satisfied with the skills taught.

Teachers were primarily responsible for development of curriculum that typically was revised annually. The process of curriculum development varied somewhat among the sites but these processes did not appear to influence job placement rates.

Instruction

Information from review of literature. Instructional development consists of planning done in direct support for student learning. Instructional development follows curriculum development. Curriculum is explicated with specifically designed strategies to aid students in learning the content, (Kindred et al. 1976). The distinctions between curriculum and instructional development are not always clear. One way educators have clarified the issue is to view curriculum as a general framework developed by a committee whereas instruction is the operationalizing of the curriculum by individual teachers.

One emerging approach to providing quality instruction is competency-based education (CBE). According to Finch and Crunkilton (1979) several aspects of CBE distinguish it from traditional instruction. The key elements include competencies, criteria used to assess the competencies, ways that student competencies are assessed, student progress through the program, and the program's instructional intent. Finch and Crunkilton (1979) have indicated that competencies for vocational-technical education are "those tasks, skills, attitudes, vafues, and appreciations that are deemed critical to successful employment" (p. 220). Whereas not mandatory elements of CBE, individualization, use of instructional technology, and systematization are often

incorporated in the CBE instructional approach used by educators. The CBE approach has become synonymous with the use of instructional modules. In contrast to the traditional instructional mode, a module is the basic instructional building block instead of a subject, unit or lesson. A module, as described by Finch, and Crunkilton (1979), is "a self-contained package that includes a planned series of learning experiences designed to help the student master specific objectives" (p. 225). Although there are advantages and limitations to using modules and CBE as an instructional approach, they represent alternatives to the traditional approach of lecture, demonstration and hands-on experiences at one pace to all students in a class.

Cooperative education is another mode of instruction used in vocational-technical education programs. Cooperative education has received a great deal of impetus in its growth from federal legislation which provided earmarked funds for cooperative education and demonstration programs in postsecondary institutions. In addition, project grants under Part G of the 1976 Vocational Education Amendments and Title IV-D of the Higher Education Act have helped many postsecondary institutions to develop and improve their programs.

Cooperative education is an educational process that combines work experience gained by students on the job with regular academic instruction as an integral part of the two-year post-secondary curriculum. It is designed to develop skills and knowledge and to improve students' self-understanding by integrating classroom study with planned and supervised experience outside of the formal classroom environment. Cooperative education is based on the principle that well-educated individuals develop most effectively through an educational pattern that incorporates structured experiences in business, industry, government, and human services. Cooperative education is typically included as part of regular instructional activities, with the institution assuming the responsibility for integrating work experience into the education process.

sites the traditional instructional approach was prevalent at case sites B, C, and D. The competency-based educational approach was used at case site A (designated a high placement site in State A).

As discussed in the curriculum section, at case site A instruction was primarily individualized, with students entering programs at any time without affecting the progress of other students.

The faculty handbook states:

Instructional facilities and equipment shall provide learning experiences comparable to those typical of the occupation. Instruction shall not be confined to the classroom. Training stations within the occupations shall be utilized whenever necessary to maximize the learning experience of the students.

Most teachers expressed their support of the individualized system, but some reservations were indicated. Some teachers reported that this system was quite demanding for them. They were expected to monitor the individual progress of their students and be available for any questions. If several students were having problems, they could dominate most of the instructor's time. On the positive side, teachers mentioned that by using the individualized approach students could work at their own pace. Bright students were allowed to progress rapidly, while slower students were also free to move at their own rate. One teacher mentioned that "it was more of a challenge, that instructors must be prepared to answer questions over all materials not just what had been covered in a lecture."

A time limit of ninety-two weeks had been instituted to prevent students from staying in a program indefinitely. According to one instructor, "this time limit is occasionally extended for students who need extra time for legitimate reasons, as determined by a committee of instructors and counselors."

Traditional methods of instruction were used at case sites B, C, and D in contrast to case site A. Lectures were used, with hands-on experiences and skill building in the vocational-technical areas where appropriate. The teachers who were interviewed felt comfortable with this approach and did not suggest major changes.

Information from the mail questionnaire. Teachers were. asked in the mail questionnaire to indicate the types of instructional methods they used to teach job placement related activities. As the data show in table 46, regular class instruction and presentations by staff were used most frequently. A high percentage of respondents indicated however, that no instruction was provided for the activities listed on the questionnaire: writing resumes, locating jobs, filling out job applications, setting up job interviews, participating in job interviews, and obtaining job information. Presentations by guests and selfinstructional materials were reported to be used least frequently of the types of instruction listed in the mail questionnaire. Although responses, varied across the sites and types of sites, it appeared that instruction in obtaining job information was provided most frequently of all the types of activities listed in the mail questionnaire.

Postsecondary institution personnel who responded to the mail questionnaire indicated the percentage of time they spent per week in providing instruction in job obtainment skills. As shown in table 47 the majority of the teachers and counselors did not respond to the question. Teachers and counselors who did respond indicated a range of 0 or 10 percent of time spent in providing instruction in job-obtainment skills. Job placement specialists who responded indicated they spend between 0 and 20 percent of their time providing instruction for job-obtainment skills.

The majority of employers who responded to the mail questionnaire indicated, as the data show in table 48, that they rarely or never served as guest lecturers for the vocational-technical education programs. This finding is consistent with what the teachers' reported (table 46) that a minimal amount (0 to 22 percent) of instruction was provided by guest speakers.

As indicated in table 49 employers reported how often they participated with the postsecondary institution in the conduct of cooperative education programs. In States B and C approximately half (46 to 62 percent) of the employers never participated in cooperative education programs. In State A approximately a third (30 to 36 percent) never participated, whereas in State D approximately a fourth (20 to 25 percent) of the employers never participated in cooperative education programs. The responses of those employers who participated in cooperative education programs varied from very often (4 to 13 percent) to rarely (4 to 20 percent). A number of employers indicate that they sometimes participate in cooperative education programs (10 to 36 percent).

Employers who responded to the mail questionnaire indicated the amount of assistance they provided vocational-technical education student organizations. The data in table 50 show that the majority (56 to 72 percent) of the employers never assisted with vocational technical education student organizations. Those who did assist with student organizations did so sometimes (4 to 22 percent) or rarely (7 to 21 percent).

Summary. Instructional approaches commonly used in vocational-technical education are the traditional classroom lecture with some postsecondary institutions using cooperative education and individualized, competency-based methods. At three of the case study sites the traditional lecture method was used. Data from the mail questionnaire sites also indicated that the lecture is a common method of instruction in postsecondary institutions. One of the case study sites used an individualized, competency-based instructional approach. The case study site using the individualized, competency-based approach had a high job placement rate and it appeared that this approach contributed to higher job placement rates. There were no apparent differences in high and low job placement sites regarding the

amount of job-obtainment skills taught. There was considerable variation among the study sites concerning the use of cooperative education, but no clear trends emerged.

Counseling

Information from review of literature. Two-year postsecondary institutions attract diverse students whose developmental levels and needs for counseling are distinctly disparate. As part of their mission, two-year institutions provide
counseling services to help students reach their goals. Harris
and Rach (1977) suggested that the counseling services in two
year institutions can be ambiguous and ineffective if patterned
after university or secondary school counterparts. As the mission and students of the two-year schools differ from those of
other settings, so must the counseling services be appropriate
for this distinct level of education.

A 1965 Carnegie Commission study found the counseling services of community colleges "woefully inadequate" (McConnell 1965). Since the decade of the 1960s community colleges have grown tremendously and counseling services appear to have improved in number and type of services offered students. According to Tollefson (1975), innovative efforts have been made to reach students of all backgrounds and ages. Tollefson's survey of several hundred community colleges indicated that they employ literally hundreds of new approaches to student development.

Student development is viewed as developing academic and vocational skills, understanding personal values and goals, and realizing a role in society. As Elterick, Gable and Karr (1975) pointed out, "It is essential that each community college has a well-structured, well-developed counseling program that assists in assessing students' developmental needs and employs strategies appropriate for dealing with the identified needs within each particular institution" (p. 139)."

Information from case study sites. In the literature job placement is not typically depicted as a function of two year institutional services. Similarly, at the case study sites, job placement of students was a distinctly separate function rather than part of the counseling continuum. Although job placement counselors may often be under the administration of the counseling service; typically they often report to the vocational-technical education dean or director.

At case site A (designated a high placement site in State A) the counseling system has both formal and informal elements in its operation. All students who apply to the vocational-technical institution see an admissions counselor to discuss the

program area they have chosen, or if undecided, to discuss what programs are available. Counselors help with students career exploration, frequently using a computerized career information system.

Once enrolled in a particular program, students are required to attend an orientation session. Orientations are held once a month; and individual orientations are held for those persons entering between formal sessions. The orientation sessions include counseling by teachers, which includes discussion about the competencies that must be acquired in order to complete a program and the skills needed in order to be successful in the program.

The counseling staff is large, with counselors offering ... financial aid, personal services, admissions, and placement counseling. Most of the counselors have backgrounds in vocational or other education fields, as well as degrees in counseling. All counselors agreed that vocational education is very important and very worthwhile.

The counseling staff interact frequently and often share work responsibilities when needed. All counselors felt that their ongoing contacts with students had an eventual positive effect on job placement of students. As one counselor stated, "If all counselors do their job effectively, then students will have all the assistance they need to complete the program and be qualified for placement into employment." The interviewer found that interview appointments with counselors were often delayed due to their commitment to meeting students needs first.

At case site B (designated a low placement site in State B) both personal and career counseling are available to students. According to a self-study conducted at the college in 1975, the emphasis of the guidance and counseling department is academic and career counseling.

The counseling staff is a diverse group, with varying back-grounds in technical and academic fields. Counselors are not required to be certified, but several academic counselors had been certified by the state education agency. The technical/vocational counselors have all met the requirements of the state education agency.

Teachers reported that they spend considerable time counseling students regarding career opportunities and job-seeking skills. Teachers frequently helped students prepare resumes or discussed job openings and strategies to use in applying for the jobs. When not in class instructors had an open door policy for students, which means that their preparation for class was usually done at home. One professor said, "My office is a three-ring circus, because students are constantly dropping in."

Interviewees indicated that minimum formal counseling was offered by the counseling department. There was only one vocational counselor available for approximately 7,000 students.

At case site C (designated a high placement site in State C) a pamphlet was distributed to students, which gave an overview of the services of the counseling department. The pamphlet stated:

We assist YoU with decisions which affect YOUR educational, vocational, and personal goals, and provide appropriate support and instruction which will enable YOU to implement these decisions. These decisions may include career, educational, academic choice, or personal-social decisions.

The counseling staff of thirteen served both day and evening students. The director of counseling reported that the counselors are considered academic advisors and are responsible for helping students make their educational plans. The counselors are not responsible for personal counseling, which is available to students through three interns from a local university master's degree program in social work.

Students are asked to set up an appointment with the counseling staff after they have completed application for admission. The counseling office provides a group orientation session for new students. The director of counseling stated that, "This is the first contact the student has with the counseling service."

The students are not required to attend the orientation, but they are strongly encourge to do so. Students are not denied admission if they do not attend. Contact with students after orientation is largely on an individual basis, at the student's request.

Little or no vocational counseling is offered, other than providing information on what courses should be taken for a particular program. There is no contact between the placement office and the counseling office.

At case site D'(designated a high placement site in State D) the college catalog listed two types of counseling: career and personal. The career counseling is described as helping students to identify career and educational goals. Emphasis is placed on individual student ability as a basis for counseling. The personal counseling was described as "assisting students in exploring their growth potential and any personal concerns encountered while in college." The counseling staff of three persons developed and now offers short seminars to students about the world of work.

Although the counseling staff is small, student interviewees felt that the "personal concern" of the teachers and other staff was one of the best things about attending the college. One former student said, "I still feel that when I have a problem, I can go to see any of the counselors or teachers and they will help."

Information from mail questionnaires. The findings from the questionnaires related to the job placement functions of counseling services are discussed in the job placement section of this report. In this section information about the types of counseling provided and used by students, the selecting and recruiting of students, admissions requirements and staff involvement in counseling is reported.

Teachers who responded to the mail questionnaire reported that they do not spend much of their time providing career counseling to students. Table 51 shows that teachers spend a minimum amount of time on career counseling. Less than a third (11 to 32 percent) of the teachers indicated that they spend up to ten hours per week on career counseling. Counselors and job placement specialists tended to spend more time than teachers on career counseling.

As table 52 shows, the majority of counselors (90 to 100 percent) who responded to the mail questionnaire felt they were very or extremely knowledgeable of the vocational-technical education program in their institutions. The data in table 53 showed that a majority of the drans/directors who responded to the mail questionnaire indicated that counselors had the primary responsibility for recruiting students for the vocational-technical education programs. In States B, C, and D the deans/directors expressed considerable support for members of the advisory committee having primary responsibility for recruiting students. Few of the deans/directors indicated that teachers have a primary responsibility for recruiting students.

When asked who had the primary responsibility for selecting students the deans/directors indicated a preference for counselors. As the data in table 54 indicated the deans/directors also considered teachers and deans/directors to be fairly important as having a primary responsibility for selecting students.

As noted in table 55, teachers who responded to the mail questionnaire (table 55) indicated that the most important criterion for admitting students to the vocational-technical education program was either anyone who wishes to enroll (33 percent to 58 percent) or student's career objective (14 to 36 percent). In States B, C, and D, 15 to 17 percent of the teachers from low placement sites indicated that minimum grade point average was the most important criterion for admitting students as compared to 0 to 8 percent of the teachers at the high placement sites. In State B almost a fourth of the

teachers from high placement sites indicated results of standardized tests as the most important criterion for admitting students to a vocatonal-technical education program.

Counselors, current students, and former students responding to the mail questionnaire indicated whether or not specific counseling services were available at their postsecondary institutions. In table 56 the responses indicated some differences of opinion between counselors and students, with less differences between current and former students. With some exceptions, most (89 to 100 percent) of the counselors at both high and low. placement sites indicated that counseling on course selection, counseling for future educational opportunities, counseling for career possibilities, and counseling for career selection were all available. A slightly lower pertentage of former students were aware of the available counseling services than the current students. The majority of former and current students at high and low placement sites appeared to be aware of specific counseling services available to them at their possesecondary institutions.

Students were not as likely to know that psychological counseling was available at their postsecondary institutions. As the data in "table 56 show the majority (60 and 67 percent) of the counselors in State A indicated that psychological services were not available whereas the majority (50 to 100 percent) of the counselors from the other three states indicated that they were available. With few exceptions the majority of both former and current students did not believe psychological counseling services existed at their institutions.

Counselors who responded to the mail questionnaire indicated the types of conditions under which students are required to seek counseling. As the data indicate in table 57, there was no consistent pattern across responses among the states or the high and low placement sites. With the exception of State A the majority of the counselors (50 to 100 percent) in States B, C, and D indicated that students did not have to see a counselor before enrolling in a vocational-technical education program. In State A, all counselors indicated that students must see a counselor before enrolling in a vocational-technical education program. The majority (67, and 83 percent) of the counselors in low placement sites in States A and B indicated that students must see a counselor when leaving the program, whereas the majority (50 to 100 percent) of counselors at the remaining types of sites. indicated students did not have to see a counselor. In States A and D the majority of the respondents (83 to 100 percent) indicated that students must see a counselor when transferring from one program of study to another, whereas in States B and C the majority of counselors (50 to 100 percent) indicated students do not have to see a counselor when transferring from one program

of study to another. In States B and C and in low placement sites in State D the majority of the counselors (50 to 100 percent) indicated that students did not have to see a counselor before dropping out of a program. At the remaining types of sites, students were required to see a counselor before dropping out of school.

Current and former students who responded to the mail questionnaire were asked to indicate what types of counseling services they actually received at the postsecondary institution. As the data in table 58 show the majority of students did not utilize the counseling services. The least utilized service was psychological counseling, perhaps because most students did not know it existed as previously reported. The majority (81 to 100 percent) of current and former students did not have psychological counseling at the postsecondary institution. There was a slightly higher percentage of students who had counseling . for course selection. In State A the majority (77 to 81 percent) did not have counseling for course selection and in State D the majority (63 to 73 perdent) did use that service. In two States B and Cthe responses were mixed, without consistant patterns between high and low placement sites'in the use of counseling for course selection. However, in State B the low placement site respondents (100 percent) indicated they received no counseling on course selection.

The majority of students (50 to 100 percent) did not receive counseling regarding career possibilities, career selection, or future educational opportunities. There were slightly more current students than former students who indicated that they had received some type of counseling. For the most part, however, current and former students did not avail themselves of any of the counseling services even when they knew they were available.

Summary. At the case study site job placement was seldom regarded as a counseling function, although at some institutions it was administered through the counseling service. Findings from the study indicated that a broad range of counseling services were available, often with functions that overlapped or complemented those of the job placement services.

The contact students were required to have with counselors for course selection, and program changes varied among the participating sites. Although most traditional types of counseling were available, they were not frequently used by the students.

Teachers appeared to have a major role in providing counseling at the case study sites although that finding was not suported by the data from the mail questionnaire. At high placement case study sites teachers provided students with more career and job-oriented counseling than teachers seemed to provide at low placement sites.

Job Placement

Information from review of literature. Most postsecondary institutions have job placement specialists (Smith 1981). Job placement specialists have varying titles and concomitant responsibilities. Some of the commonly used titles are (Barrow 1976) as follows:

Placement Coordinator/Placement Director--Responsible for all aspects of placement service. May carry out total services or supervise team of full- or part-time specialized staff.

Placement Counselor-Member of regular counseling staff with designated responsibility for placement service. Can be member of placement service team with responsibility for career planning, pre-employment preparation, and job adjustment counseling students.

Placement Specialist--Member of school staff with designated responsibility for placement service area. Can be member of placement service team with responsibility for job development, employer contact, labor market information, placement referral, and/or follow-up.

Occupational Information Specialist--Liaison person from state employment service or designated member of placement . service team with responsibility for labor market and occupational information as resource to students and staff.

Job Development Specialist—Member of placement service that with responsibility for initiating and maintaining regular contact with employers to identify employment opportunities. Through personal visits and other methods solicits employment opportunities, refers students, and maintains current information on outcome of referral and employment openings.

Secretary/Clerk--Carries out operational functions in placement office such as answering telephone, follow- through telephone or mail contact to verify outcome of referrals and current employment opportunities, maintains order of files and records, posts career placement notices, scheduling of appointments for placement staff.

The responsibilities and duties of job placement specialists include these:

- 1. Coordinate career assistance and placement services.
 - a. Cooperate closely with oth r school departments, especially counselors, faculty, vocational administrators, and advisory committees, in developing placement service policy.

- b. Develop and carry out public relations efforts in the school and community, including working with advisory committee, other local schools, and employer groups.
- c. Systematically acquire and update local employment information.
- d. Participate in relevant professional, development activities to promote placement service improvement.
- Prepare students for employment
 - a. Conduct studies as necessary to identify student needs for specific career assistance and placement services.
 - b. Bevelop methods and materials for preemployment preparation of students, both individually and in groups.
 - c. Advise counseling staff in acquisition and use of information on career planning and the labor market.
- 3. Operate placement office to effectively serve students, employers, and school staff
 - a. Assist students to prepare for and obtain job or educational goals through personal interviews, telephone and mail contacts, posting of opportunities, and notices to faculty.
 - Develop student job opportunities through visits to and from employers, and records of potential employers.
 - c Bring students and employers together through such methods as current jpb orders, direct personal referral, job bulletins, candidate lists, campus recruiting, career fairs, and student placement credentials.
 - d. Follow through on all operations, including determining putcome of referrals, updating registrant files and job orders, and accurately recording all office activities.
 - . Evaluate and improve the placement program.
 - a. Continually evalute placement methods, policies, and activities through surveys, analysis of office activity records, and cost review.
 - b. Participate in the design and analysis of

school follow-up studies to obtain evaluative feedback.

[Prepare an annual report detailing operation and evaluation of the placement a service. (Barrow 1976).

Information from case study sites. At case site A (designated a high placement site in State A) job placement was a major priority. The state department of vocational education required that programs have a placement rate of 51 percent or be terminated. A state administrator said.

If a program were approaching anything close to only a 51 percent placement rate, I would have already been on to it. The directors know what the schools are there for. They have a singular purpose, to prepare people for employment. That's their goal.

The most striking feature of the placement system at site was its flexibility. Responsibility for placement was shared equally by counselors, teachers, and a job service counselor who was employed by the state employment service and located at the school. A teacher summed up placement at the school as "a very cooperative effort."

The teachers appeared to recognize that job placement was one of their responsibilities. The teachers stated that they actively pursued job placements for their students through contacts with employers in the community or the job service counselor. They also reported that employers now contact them regarding job openings. Several teachers reported that they carefully screen students they refer to employers, so that "square pegs aren't placed in round holes."

The job service counselor viewed his role as providing the greatest number of job options to the greatest number of students. The counselor's duties included: (1) receiving job openings from employers who contact the school or from the state employment service (SES) job bank, (2) informing instructors and students of the openings, (3) matching students to jobs and arranging job interviews, (4) conducting small group workshops on job seeking skills with students, (5) conducting public relations activities with employers concerning the school, and (6) posting part-time job openings for students who desire part-time work while attending school. In addition, the counselor provides labor market information to the staff.

The teachers and counselors consistently reported high placement rates for students completing programs and also for those who did not. They maintained that eventually all the students who wanted to work in the area for which they were trained found jobs.

Employers reported satisfaction with the placement system. Some employers supported the fact that they contact teachers at the school when they had openings, others reported that they go directly to the state employment service (SES).

Several interviewees stated that, due to the recent economic slowdown, more emphasis had been placed on finding jobs outside the local area. Students were being encouraged to relocate outside the area. In addition, more use had been made of the SES job bank, which lists openings throughout the state.

At case site B (designated a low placement site in State B) the job placement office was staffed by two full-time workers. For a typical job referral, an employer called the job placement office and described the available job to a staff member. The staff member then typed the job description and placed it on the job-posting board in the vocational-technical education center. In addition to posting jobs on the job board, the job placement staff searched newspapers for job openings, conducted one-day workshops for students on how to get a job, invited and coordinated the activities of job recruiters on campus, and met with area employers to explain the program offerings at the institution. According to one job placement office staff member, "During a typical week the job placement office would be in contact with about fifty employers.".

Although the job placement office was active in job placement, it appeared that the bulk of job placement was conducted by faculty members. Interviewees stressed that the strengths of the placement activities lay in the network faculty members maintained with employers: A typical statement made by one of the teachers was:

Most of the faculty have professional contacts in town. Last week I received a phone call from an employer who said he had to have someone. He said he wasn't telling anyone else about the job and for us to send some students over.

Faculty members could not provide exact placement rates for their program, but they felt that they placed between 80 to 95 percent of their students in training-related positions. Not one interviewee said that job placement was a major problem. Most of the faculty like the informal and flexible nature of job placement at the school. They tended to feel that since job placement rates were high, there was no need to overhaul the present placement system. As one department chairman said, "It's an informal system and that's all it needs to be really, as far as we are concerned."

Placement procedures differed somewhat among the various vocational-technical education programs? In some programs there

udents, in others the job board was used extensively and in others job fairs were the major placement activity.

At the time of the interviews, the position of job placement director was unfilled and applications were being accepted. The position was to be funded through the counseling office. According to the job description, the position will be filled by a doctorate level counselor with experience in business. Several interviewees disagreed indicating that the position should be filled by someone with a business background, familiar with the local area business community, rather than a counselor. The assistant director said:

In my way of thinking it should be a business person, because we need a person who knows the community and knows the people in the community. The counseling part is very nice, and the job placement office could do career counseling, but that function is already being done. So I think we need a person who is a public relations person to get out there, talk to people, tell them about the school and the faculty.

The faculty's relationship with the job placement office varied. Some faculty members worked closely with the job placement office; others criticized it; while others did not seem to know it existed. The assistant director of the job placement office said:

I think there is some lack of communication between the job placement office and the faculty. I think there will always be some faculty members that will not see any function in the job placement office, but I think a lot of it is a lack of not knowing what we do here.

The job placement office at site C (designated a high placement site in State C) had one full-time professional to serve 19,455 students. The placement office was considered a student service, where students could come for information about the community, the college, and jobs. The director of the job placement office described the position as:

I'm in charge of a myriad of things, so to provide one-to-one job counseling to all students is impossible. There is just no way. I'm open for a student who wants to see me, but I just can't meet one-on-one with everybody.

1

Job placement activities were conducted by many teachers and support staff. The placement director stated:

I give the instructors the credit for jo' placement, because they're my pipeline. The job placement office is a clearinghouse. For example, I get a phone call from a company, they have a specific need, I look through the files to see if any students are looking for positions in the area, and if they are 'qualified for the position. Second, I funnel the information about the job to the instructors. The instructors announce it to the class, pass it, or select a student to tell about the job, or a combination of the three. In addition if its a large demand. I start advertising the opening in the student bulletin. Occasionally, I advertise in the city newspaper and we have ·a job listing board in the office.

The placement director has held an employer's day annually, when employers are invited to the campus to meet the students. Approximately thirty-five or forty employers, representing all kinds of businesses, have typically attended.

Other responsibilities of the placement director include , contacting employers as a public relations function, and presenting programs on the world of work in classes at the college.

The placement director said, "I feel I have done a good job. The college has the highest placement record for the community college district." According to a teacher, "The placement office does an excellent job, especially since it receives little or no support from the administration." Several interviewers observed that a major portion of the placement director's time was spent in filling out reports, that the job was almost all paper work.

At case site D (designated a high placement site in State D) the job placement function was almost nonexistent. The major activity of the person in charge of placement was helping students transfer to four-year institutions. According to the college catalog, the job placement service "assists graduating students and abumni seeking appropriate full-time employment and/or training." During group interviews students explained that the placement office is not active.

The person in charge of job placement explained his responsibility by saying:

Right now, as far as the way we are currently operating placement, it's primarily a maintenance function where students are notified

about jobs via intercampus mail, memos posted and so forth, or announced in class. A couple of times during the year, I put up posters reminding students to come in and register with the placement office. If they do, I set up a file listing students under areas of interest, so if a position becomes available we can contact them.

Previous job placement personnel had written a booklet about job search strategies. The booklet included how to do resumes, what is an application, how to fill out applications, and how to write follow-up letters.

Most students indicated that the college had "no responsibility for job placement." Employers interviewed usually did not contact the job placement office, but called the teachers directly regarding job openings.

The job placement director stated that, "Only 150 to 200 students use the job placement service in a year, and most of those are for part-time jobs." It was evident that the college does little to place students from vocational-technical education programs in jobs in the community.

Findings from mail questionnaire. Job placement specialists who responded to the mail questionnaire reported, as shown by the data in table 59, that their institutions typically have one to three full-time persons responsible for job placement. The typical response, however, for the few respondents to the questionnaire, was that there is one full-time job placement specialist at each institution.

The teachers and job placement specialists who responded to the mail questionnaire indicated, as shown by the data in table 60, the types of support provided for job placement services in their institution. Except for respondents from high placement sites in State A and low placement sites in State D, the majority of the teachers reported that they did not have secretarial assistance with job placement responsibilities. The majority of job placement specialists reported the opposite, that they did have secretarial assistance available. In State A, high placement site teachers were again the exceptions in reporting they received mileage reimbursement for automobile use although the majority of teachers at the remaining sites reported they did not receive mileage reimbursement. The majority of the job placement specialists at all sites reported that they did receive mileage reimbursements. The majority of both teachers and job placement specialists indicated they had toe use of a telephone, office supplies, access to duplicating, and postage for job placement The majority of teachers reported that they had no release time for job placement activities. The responses from

the teachers and job placement specialists were mixed regarding the availability or use of inservice training. Neither teachers nor job placement specialists consistently reported they had or had not received inservice training, although it appeared that the majority had not had inservice training.

Postsecondary institution personnel, former students, and current students responding to the mail questionnaire indicated as shown in table 61 the sources that are "very much help", for vocational-technical students in providing information about job openings. Current and former student responses were compared as a group to the responses of teachers, counselors, and job placement specialists as a group. < Except in State D, both the student and postsecondary institution personnel groups ranked teachers first in providing "very much help" regarding information about job openings. In State D, the respondent groups from the high placement site ranked the job placement service first in providing "very much help" about job openings information. remaining rankings varied, especially between the groups of scrool personnel and students. Although most of the postsecondary institution personnel rated the job placement service second or third, most students rated it fourth or \fifth. Students most frequently rated newspapers second and friends third. secondary institution personnel tended to rate school-based services higher than students who indicated parents and others outside of the school were more helpful in providing information about job openings. Both students and school personnel tended to rate private employment agencies and radio/ television announcements lowest as being helpful in providing information about job openings.

Current and former students who, responded to the mail questionnaire indicated what placement services they believed to be To answer this available at their postsecondary institutions. question students were asked to indicate if they believed the particular service was available with the nonresponses inferring it was not available. For the most part, current and former students agreed with each other, as shown by the data in table Although the majority of students in State D (65 to 73 percent) believed that assistance in advanced educational placement was available at their institution, the majority (55 to 75 percent) of the students in the remaining three states did not believe it was available. Responses were mixed regarding the availability of training in job-seeking skills. The responses tended to indicate that training in job-seeking skills was not available with the exception of the responses from students in State D. With the exception of students in State A, the majority (52 to 75 percent) of current and former students did not believe that their institution contacted employers about jobs for A greater proportion of students, (59 to 96 percent) did not believe that their institution worked with either public or private employment agencies regarding jobs for students. With some exceptions, most of the responding students believed that their institution does provide information about job openings and refers students to job openings.

Current and former students and school personnel who responded to the mail questionnaire rated their institutions performance in providing specific job placement services (See tables 63,64,65, and 66). The particular services rated were: providing training in job-obtainment skills, contacting employers about jobs for students, referring students to job openings, and providing information about job openings. In general, school personnel gave higher ratings than students regarding their institution's provision of job placement services. There were no consistent patterns of response in the ratings between high and low placement sites or between current and former students. greatest difference in ratings between the groups of students and school personnel was for providing job-obtainment skills as shown by the data in table 63. The rating by school personnel were good, whereas student ratings were from failing to excellent with many "don't know's." Contacting employers about jobs, as shown in table 64, was rated "good" to "excellent" by school personnel, although more school personnel rated that service excellent, whereas students rated it fair. In table 65 the data indicate that school personnel rated referring students to job openings as good to excellent, whereas students tended to rate this service as fair to good. As shown in table 66 school personnel tended to rate providing information about job openings as good to excellent'whereas most students rated it fair to good, with some ratings of excellent.

Teachers and job placement specialists who responded to the mail questionnaire indicated the kinds of activities they conducted when referring students to job openings. As the data in table 67 indicate, approximately half of the teachers did not respond to the question. The teachers and job placement specialists who did respond indicated that of the four activities listed, the most frequent activity was to provide students with information regarding jobs, such as wages or benefits; the second most frequent activity was to provide employers with student information such as class performance; the third most frequent was to make telephone calls to employers recommending students; and the least frequent activity was to send employers written recommendations concerning students.

In table 68 the data show the responses of teachers, counselors, job placement specialists, advisory committee members, and former and current students concerning their opinions of which factors increased the chances of employment for former students of vocational-technical education. The responses to this question showed similar opinions among the respondent groups regarding the five factors that were listed, which were: basic educational skills, occupational skills and competencies, human

relations skills, positive work attitudes and previous work experience. Seventy-one percent in high placement sites and 81 percen, of the teachers in low placement sites indicated that the factor of occupational skills and competencies was "very much' help" for students in obtaining jobs. A somewhat lower percentage of teachers indicate "very much help" responses for the factors of positive work attitudes, followed by basic skills, human relations skills, and previous work experiences. There was less consensus among counselors and job placement specialists who responded to the question than among the teachers; although the majority tended to agree that occupational skills and competencies were important for students in obtaining jobs. Advisory committee members tended to agree with the teachers' opinions, although they place somewhat more emphasis on basic skills as "very much help" for obtaining jobs. Current students also agreed with teachers, and tended to have less differences in percentages among the five factors. The responses of former ·students tended to mirror those of the current students but the percentages were considerably lower, possibly indicating that former students did not feel any of the five factors were as much help as perceived by the current students and other respondent groups. There were fer differences in the response of current and former students by high and low placement sites.

The employers' questionnaire had a slightly different question than the other respondent groups to obtain their views, about the importance of specific factors when hiring a person for an entry-level job (table-69). At both high and low placement sites, in all four states employers (52 to 76 percent) indicated that the factor of work attitude was most important when deciding to hire someone for an entry-level position. Employers indicated that the ability to get along with people was also very impor-The remaining factors listed in the questionnaire item received varying percentages of "very much importance" responses. For example, school attendence and job interview performance received a high percentage of "very much important" responses in States A, B, and C. Although there were no consistent patterns there were differences within the states in opinions between high and low placement site employers. For example, in State D high placement site respondents indicated that amount of previous work experience and scores on company administered tests were very important when hiring a person for an entry-level job.

As shown in table 70, respondents to the mail questionpaire indicated how much difficulty certain factors pose for vocational-technical education graduates when they attempt to obtain jobs. The responses to the question varied within the states between high and low placement sites and among the various respondent groups although there were trends in the factors that pose considerable difficulty when attempting to obtain jobs. The factor receiving the highest percentage of posing considerable difficulty responses was "no job available." Others factors receiving high percentages of posing considerable difficulty

responses were "students must compete with experienced workers," "students unwilling to move for a job," and "students do not have specific skills."

In State A current and former students at high placement sites emphasized "age discrimination" as a factor posing considerable difficulty for obtaining jobs whereas none of the employers indicated sex discrimination as one of the factors posing "very much difficulty." Employers did not strongly indicate that any of the factors posed much difficulty, but they did place more emphasis on "no jobs available" and "students do not have specific job skills" than on other factors. In State B, "lack of transportation" was emphasized as a factor causing considerable difficulty for obtaining jobs by advisory committee members from high placement sites. In State C. "entry jobs offer only minimum wage" was emphasized by teachers, counselors, and employers at low placement sites as well as current and former students from both types of sites. In State D, "entry-level jobs offer only minimum wage" was also emphasized by employers and students from high, placement sites as a factor posing considerable difficulty for students when obtaining jobs.

Findings from the study indicate that two-year Summary. postsecondary institutions have a staff member functioning as the job placement specialists whose responsibilities range from posting jobs to administering a full-scale placement office. most salient finding from the study regarding the job placement process was that a well-organized effort often coordinated by a job placement specialrst who had the cooperation of faculty and administrators was necessary for high job placement. Although it appeared that the sites in the study, had job placement services, the diversity of such services indicated that staff-wide cooperation and focused coordination was necessary to maintain the high level of effective communication with employers and students that was required for high job placement. Additionally, job placement was enhanced by strong ties with the public employment services and a high level of cooperation with economic developers in the The process of job placement appeared to be most effective where there was flexibility and responsiveness to employers, students, and school staff.

Staff Characteristics

Information from review of literature. According to the American Association of Community and Junior Colleges (AACJC: 1980), as of October 1979, there were 212,173 faculty employed in approximately 1,230 two-year postsecondary public and private institutions. In 1979, 44 percent of the faculty taught full-time with a teaching load of nine or more credit hours. Two-year teachers spent more time in the classroom than their four-year counterparts. Most faculty taught twelve to seventeen

hours per week, with an average of fifteen hours per week. The mean age of two-year institutions full-time faculty was forty-two years. Seventy-one percent had a master's degree while almost 10 percent held a doctorate (Graybeal 1979).

The average salary for full-time faculty was \$17,820 for all ranks combined, with \$14,800 for instructors, \$16,660 for assistant professors, \$19,820 for associate professors and \$23,240 for full professors. The breakdown of full-time faculty was 12.6 percent full professors, 25.8 percent associate professors, 37.2 percent assistant professors, and 24.4 percent instructors.

Two states require a formal teaching certificate. The requirements are usually somewhat different for faculty teaching in academic programs than for those teaching in vocational-technical programs. Certification requirements for teachers in technical fields typically include having a schelor's degree with experience as a technician in the field.

In addition to faculty, 16,155 other professionals, including administrators, librarians, and counselors, were employed. Almost 26 percent of the administrators held a doctorate. Approximately 14 percent of the administrators and 16 percent of the professional staff were from minority groups.

Information from case study sites. The faculty and professional staff at the case study sites appeared to reflect the national averages in terms of degrees held, hours worked and so forth. At case site A (designated a high placement site in State A) the postsecondary institution had a staff of eighty-saven. Five other administrative staff were located at the central administrative offices and rotated their visits to the postsecondary institution. The faculty all had on-the-job experience and had a teacher education degree or were working toward the degree. Two staff members were minority, one was a teacher and one one was in charge of minority affairs.

Teachers appeared to be concerned about their students and dedicated to helping them make approprite career decisions. They avidly sought placement for students through their network of employers, some of whom were former students. Students, who seemed to like their teachers, made the following statements about them: "They are the best I have had in sixteen years of school," and "Teachers are concerned about students, as contrasted to the university teachers who are not."

Staff members at case site B (designated a low placement site in State B) had earned either a bachelors, masters, or doctoral degree. In the vocational-technical education area, teachers also had at least three years of job experience in their field of instruction.

The college had a full-time faculty of 475 and approximately 545 part-time faculty. There were 146 full-time vocational-technical education faculty. Forty-six percent of the faculty were women; 93 percent white; 6 percent Hispanic; and 1 percent black. Typically, the full-time faculty taught during the day, with a average load of fifteen semester hours; whereas the part-time faculty taught night classes. Department chairpersons taught twelve hours in addition to their administrative responsibilities.

A recent report (1975) conducted by a committee from the Southern Association of Colleges and Schools, the accrediting board, stated, "The college has an excellent faculty. There is a remarkable degree of faculty stability, and the affective relations such stability gives is reflected in the student-faculty relations." "Many of the faculty were retired from the military with high levels of skill and academic training received while active," according to a mid-management administrator.

Although the case study site was designated as low job placement in relation to others in the state, there was a great deal of job placement activity among the teachers. In every program area there was at least one self-appointed teacher who took pride in placing students in good jobs. The teachers viewed job placement as part of their role despite the presence of the job placement specialists. Teachers often assisted former students as well, making special efforts to contact them when a particularly good job was announced by an employer.

At case site C (designated a high placement site in State C) there were approximately 285 full-time equivalent teachers in the day and evening programs. Eighty-six percent of the evening staff were employed on an hourly basis to teach one or two classes a week. Most day teachers had a ten-month contract.

Teachers at this case study site had mixed reactions to job placement, often remarking that they "wouldn't get credit for it anyhow" since the placement figures are reported through the job placement office. Teachers did provide vocational counseling and did make job placements whenever it was opportune, but did not appear to be enthusiastic or rigorous in their efforts. Several teachers did not believe it was part of their job description and were somewhat befuddle; about making contacts with employers in their large community. Other teachers indicated they should, and indeed did, make some job placements, especially, those who "moonlighted" and therefore had a network of colleagues in their field who would ask for student recommedations for employment.

At case site D (designated a high placement site in State D) there were seventy-three full-time and fourteen adjunct faculty. Most of the staff held master's degrees. The nursing staff held baccalaureate degrees, but legislation was recently passed that stipulated that all nursing faculty must hold master's degrees by

hold master's degrees by 1990. A plan was being developed to provide sabbactical leave on a rotating basis to allow nursing staff to acquire the necessary degree.

The faculty reflected the community in minority representation. The director of affirmative aution stated": "Minorities are practically nonexistant in the area and college. We have one part-time black, and two full-time Asians." The president, a dean, and a division head were females, but according to an administrator, "men certainly predominate in professor and associate professor positions. One reason is that men stay on and on."

At this site teachers were academically oriented regardless of their vocational-technical field. Teachers believed, as did the administrators, that the school's purpose was to provide a two-year education that was transferable for further study at one of the numerous four-year institutions nearby. Being located in an isolated community with minimal entry-level job opportunities increased the teachers' belief that students could not be placed in related jobs. As a result, whereas job placement was desired, the reality of the situation appeared to promote the teachers' productivity to teaching transferable courses and seldom attempting to place students in viable positions in the community.

Information from mail questionnaire. School personnel who responded to the mail questionnaire reported the certificates they held in various fields. As the data show in table 71, most administrators held a certificate in administration, teachers held degrees in education or a broad range of subject fields, counselors previously held degrees in guidance/vocational counseling or administration, and job placement specialists held a variety of degrees. The fields most frequently indicated by teachers were trade and industrial or health education.

In table 72 the data show that the majority of teachers, counselors, and job placement specialists worked thirty-one to forty hours per week. There were no apparent differences in hours worked between high and low placement sites.

Respondents to the mail questionnaire indicated their highest level of education. In table 73 the data show that in State A directors of the technical schools had a master's degree or beyond. In the States B, C, and D, 20 to 100 percent of the deans/directors of the community colleges held doctorates and the remaining had a master's degree or beyond. In State A the typical respondent level of education was beyond four years of college whereas in the other states the model level was beyond a master's degree. The majority of counselors and job placement specialists had degrees above the master's level.

Teachers indicated, as shown in table 74, that they made one to three class preparations per day. With the exception of State A, the teachers in the low placement sites made slightly more preparations per day than did teachers in high placement sites.

As shown by the data in table 75, the majority (67 to 100 percent) of dean directors who responded to the mail question-naire indicated that teachers' ability to place students did not affect tenure, salary increases, or termination of employment. In State D, deans/directors from high placement sites indicated that promotions was affected by placement ability. In the other states promotion was not affected by placement ability according to the majority of the deans/directors (67 to 100 percent).

Summary. Teachers' commitment to job placement as their, responsibility appeared to be a strong factor in attaining high job placement rates. In the state with the highest placement rates teachers' promotion were affect if by their record of job placement. As the findings from the case studies indicated the level of job placement strongly related with teachers belief that it was their responsibility to place students in jobs related to thier training.

Student Characteristics

Information from Review of Literature: Enrollment figures for 1979 showed that 4,487,872 students were enrolled in two-year institutions across the nation for credit courses. This represented 39 percent of the total undergraduate enrollment nation-Approximately 50 percent of the full-time students and 87 percent of the part-time students were employed. percent) of the students were women and over a quarter (27 percent) of the enrollees were minorities. The mean age of two-year institution students enrolled for credit was twenty-seven with a In comparison to students at four-year institumedian of 23.3. tions, students at two-year institutions were older, were more likely to be married, came from less affluent homes, and had parents with less education. Over a fourth (26.7 percent) of the Most of the two-year students commuted a students were married. median distance of 7.5 miles. Two year institutions enrolled 90 percent of their students from within the state (AACJC 1980; Gilbert 1979).

Since 1960, enrollment in vocational-technical education programs has grown at a higher rate than total enoughent because students have been interested in obtaining a job or improving their work life. By 1978, 52 percent of the enrollment was in vocational-technical education programs. The majority (79.4 percent) of full-time students cited "ability to get a better job" as their primary reason for being in postsecondary education

programs (AACJC 1980). In the 1976-77 school year 58 percent of the associate degrees were awarded for vocational-technical education programs. Over half (51 percent) of these degrees were for science or engineering related programs. The greatest numbers of vocational-technical education students were enrolled in business, commerce, management technology, nursing and allied health; electronics and machine technology, and police and corrections.

Information from case studies. The student population of the case study sites differed somewhat in ethnic makeup but otherwise they were similar to the information in the literature. Case site A (designated a high placement site in State A) had a minority population of less than 1 percent, most of those being Native Americans. Over a third of the students were receiving some type of financial aid. The largest amount came from basic education opportunity grants, with \$252,246 for 450 students. Most students were married, and most planned to stay in the community when they completed the program.

education programs at this site because they believed their opportunities for entry-level jobs or advancement in their field would be enhanced. Students had the opportunity to advance at their pace and work toward certification in fields that virtually guaranteed them high paying jobs. Students appeared to be committed and enthusiastic about their programs, courses, and teachers, and optimistic about their chances of being placed in related jobs. At case site B (designated a low placement site in State B) approximately 1,310 more females attended the post-secondary institutions than males. The ethnic breakdown was black (8.7 percent,) white (47 percent), Hispanic (43 percent) and others (1.8 percent). The majority of students were between eighteen and twenty-four years of age and the majority were single.

A study conducted at case site B, from 1971-1979, found a significant difference between sex and the reasons that students did not return to the school. Reasons for males not returning to school included: already completed the courses needed; transportation problems, and conflicting job hours. The reasons for females not returning included personal or family reasons, financial problems and dissatisfaction with course content.

Seven percent of the students received financial aid, most through basic education opportunity grants. A number of students participated in the college work program, which paid minumum wages of \$3.10 per hour for on-campus jobs.

Students believed their opportunities for job placement were high, especially in program areas such as computer technology. Students indicated they would have assistance from their program area teachers when they were ready to begin seeking jobs.

At case site C (designated a high placement site in State C) the percentage of ethnic breakdown for day student enrollment was black (29 percent), white (48 percent), Hispanic (15 percent), Pan Asian (5 percent) and other (3 percent). The ethnic distribution of night students indicated more white (55 percent) and less minority representation. Students believed that the labor market demand for entry-level jobs was low in their community, but training in certain fields would provide them with relatively high chances for employment. Most students knew about the job placement office but thought it provided help with part-time jobs while in school. Most students thought their teachers would help them find jobs but were anticipating locating such jobs on their own.

At case site D (designated a high placement site in State D) 42 percent of the students were enrolled as transfer students. 4-The ethnic breakdown of the day school vocational-technical program was Native American (.3 percent), black (.5 percent), and Hispanic (.06 percent), with the remaining being white. The majority of the students were not planning to use their training for obtaining related jobs in the community, primarily because there were few entry-level skilled jobs available. Many students viewed their work in the vocational-technical education programs as preparation for higher education, for "getting along in the World" or for hobbies. Those who did believe they wanted to work in the field realized they would probably have to move out of the community or go into business for themselves. Although the students had high regard for the school and their teachers, the majority did not believe it was the school's responsibility to place them in jobs.

Information from mail questionnaire. Current and former students who responded to the mail questionnaire indicated (tables 76 and 77) that most of their parents had high school or less education. Students indicated that their mothers had somewhat more education than their fathers.

Students also indicated their parents occupations as shown in tables 78 and 79. Students indicated that their mothers' occupations were predominantly homemaker or clerical. Their fathers' occupations varied more, with no strong trends across occupations. The occupations of craftsperson and professional were indicated somewhat more frequently than the other categories.

Students who responded to the mail questionnaire provided information about their reasons for enrolling in a particular vocational-technical education program. As the data in table 80 show, the major reasons for enrolling in a particular program were either to acquire skills needed for obtaining a first job or to acquire new skills in order to change jobs. In States B and C a high percentage of students indicated that upgrading skills in

occupations was a major reason for enrolling in a program. Few students (0 to 11 percent) indicated that their reason was being unable to attend a four year college.

Responding students indicated in table 81 the vocational-technical education program in which they were enrolled. Of the current and former students who indicated a subject area instead of "other," the greatest percentages were enrolled in health, trade and industrial, and office occupations. In table 82 the data show that the majority of current and former students held a job while going to school.

Most former students who responded to the mail questionnaire indicated that they held a job after leaving the postsecondary institution. As the data show in table 83, the majority obtained full-time jobs, except for students at low placement sites in State C and high placement sites in State D. The remaining students obtained parttime jobs or indicated they did "other" within six months of leaving their school. Very few students entered the military service or became self-employed. Former students had an unemployment rate of 4 to 11 percent within the six-month period after leaving the postsecondary institution.

Former students were asked to indicate the degree of similarity between the skills they learned in their vocationaltechnical programs and those used on their first jobs after leaving school. Almost half of the respondents with the exception of low placement site students in State C, indicated their job skills were the same as the ones learned in school. As shown in table 84, approximately another fourth of the former students believed their skills were somewhat related, although 2 to 14 percert believed that they were not at all related. In table 85 the data show the rating given by former students of how well their vocational-technical education programs prepared them for their first job. Between 18 and 38 percent of the former students indicated their preparation was excellent, whereas 8 percent or less indicated it was poor. Between 14 and 43 percent of the former students did not respond to the question.

Former students indicated (table 86) that in State A the most prevalent type of degree earned was a certificate of completion, whereas in states P. C, and D it was an associate degree. Former students indicate. (table 87) that in State A many held clerical and sales or service jobs when they first left their postsecondary institution. In States B, C, and D the type of job held after leaving the postsecondary institution was professional, technical, or managerial, although a sizeable number of former students in these states indicated clerical and sales or service types of jobs as well.

Summary. Except for ethnic background the descriptive findings about students were consistent with the national profile of two-year postsecondary students. There was a higher proportion of Hispanics at two sites than the national averages for two-year postsecondary institutions.

At high placement sites students appeared more optimistic about their chances for employment in jobs related to their vocational-technical education program. Students at all four sites believed that they would receive assistance from the school, especially from their teachers, in job placement. At the higher placement sites however, students strongly believed they would have job placement assistance because they knew of peers who had been placed through school-based efforts.

Program Evaluation

Information from the review of literature. The status of program evaluation was reviewed in the Vocational Education Study (NIE 1981). In summary, the 1976 Amendments to the Vocational Education Act introduced new requirements for evaluating federally-funded vocational education programs at the secondary and postsecondary levels. The purpose of the requirements was to promote the planning activities and responsiveness of vocational education to the labor market. The requirements stipulated that programs be evaluated every five years. The evaluative criteria were: (1) student placement in jobs related to their training and (2) employers satisfaction with vocational education-trained students

The information from program evaluations was to be used by the states to improve their vocational-technical education programs. Although most educators considered the evaluative criteria theoretically appropriate, they found the criteria difficult to implement. In 1976 few states had evaluation mechanisms in place that could accomplish what the requirements mandated. Between 1976 and 1978 the states developed and established evaluation procedures. By 1980 most states were routinely conducting program review and student follow-ups. The data from the student follow-up studies were reported to the Vocational Education Data System (VEDS) and aggregated at the state and federal levels.

The findings from the Vocational Education Study (NJE 1981) were that evaluations are being used to revise and improve vocational education programs in most states, although not exactly as required by the Vocational Education Amendments. More emphasis has been placed upon quantity rather than upon the effectiveness of programs. Student placement rates, as a measure of effectiveness, have not been used to a great extent. Program reviews have been providing information about quality that is being used in conjunction with placement data to make decisions and plan programs.

Information from case study sites. Program evaluation purposes and procedures varied among the four case study sites. The case study sites with the highest placement rates appeared to have more extensive program evaluation procedures in place. Additionally, at the site with the highest job placement rate (case site A) the purpose of program evaluation was directly related to the job-placement rate.

At case site A (designated a high placement site in State A) the extensive program evaluation procedures were conducted through both internal and external processes. The primary evaluative criterion was the placement rate, which was required to be at least 51 percent for a program to be maintained.

Self-evaluation was conducted by staff members two months prior to the state evaluation unit's review. The internal evaluation team was made up of faculty, students, support personnel, and administrators. The results of the internal evaluation were used to provide information to the persons who conducted the external evaluation. The purpose of the external evaluation was to verify and validate the findings of the self-evaluation. The supervisor of each program had to be present during the external evaluation process as an observer. An exit interview was given by the outside evaluation team prior to leaving the building. The state supervisor, the school directors, and the evaluation team attended this meeting. This group clarified any existing questions about evaluation before the evaluators left.

Evaluation of each program was conducted on a five-year rotation cycle. Recommendations from the evaluations were sent to the state board of education. The board allowed the school three years to follow-up and complete the recommendations made by the evaluators. The school was required to file a report every year regarding the progress made in correcting problems. If corrections were not made, the school would lose its accreditation, which would make them ineligible for federal funds.

The state evaluation coordinator stated, "We don't care if the schools protest, they aren't allowed to disregard recommendations." He noted that the evaluation had impact on job placement with local/employers in two distinct ways:

The instant and obvious benefit is that some of the people who evaluate see that they should be hiring vocational students and second, an advertisement is always placed in the newspaper concerning the employers' participation in the evaluation. This builds that critical relationship between the school and industry.

Other methods used to evaluate were follow-up studies of employers and students. The follow-up studies were not described

as a method of evaluation by the stat evaluation coordinator, , but staff believed that follow-up was

xod "to check up on

Program evaluation at case site B (designated as a low placement site in State 9) was a continuous process and included self-study, state education agency reviews of ongoing programs, state education agency staff visitations, on-site committee evaluations, and similar activities. The evaluation criteria were not explicitly related to job placement rates. The underlying philosophy strongly supported job placement as important in measuring the quality and effectiveness cf the vocationaltechnical programs.

Postsecondary staff from the state education agency conducted on-site visits to the school to provide consulting services and to obtain information needed to determine if state education agency guidelines were being followed. The institution was required to provide any data that was requested, arrange for written materials to be made available, and otherwise, expedite Reports of on-site the work of the person making the visit. visits became a matter of record. The director of the state postsecondary programs informed the institution of any major discrepancies reported.

The vocational-technical education programs were evaluated by conducting a three-year follow-up study of grates, leavers, and employers. The information gathered included data about graduates' employment status, special services, programs at the college, as well as other information pertaining to how the courses had been used after leaving the institution. rates were not considered in the program evaluation.

At case site C (designated a high placement site in State C) program evaluation was the responsibility of the district office. There appeared to be a well-developed system of evaluation that was mandated at the state level and conducted at the district and individual intitutions level. According to an administrator at the district office, "evaluations are reflections of the feedback from the advisory committees, the placement rates, dropout rates, and so forth." The district administrator regarded the evaluation as:

> informal communication with the community and with people, the employers that hire our students and the review of various reports that are deperate i on dropout rates and placement rates.

Program evaluation was initiated at the district level, but the gathering of essential information was the responsibility of the dean of instruction at the school. Six areas considered when

conducting program evaluation were: enrollment, dropout rate, placement rate, cost of program, the status of the equipment, and the available facilities in which to conduct courses. Job placement rates were not an explicit evaluative criterion. District administrators stated, however, that if a program's job placement rate dropped below an unacceptable rate which he did not specifiy, it would be investigated.

At case site D (designated a high placement site in State D) programs receiving federal grants were evaluated in the process of completing the federal reports that were required. Evaluators were sent from the state department periodically to evaluate programs that received federal money.

The dean of instruction reported that the programs not receiving federal monies were evaluated through an informal process. The dean said, "They are evaluated by the advisory committee members and by the staff, and changes are made as a need is felt." The evaluative criteria were vague; job-placement rates were not considered, according to the dean, as part of the evaluation of a vocational-technical program.

Information from mail questionnaire. The majority of deans/directors who responded to the mail questionnaire reported that various program evaluation activities had been conducted annually. As the data show in table 88, students who completed their programs (completers) were followed-up in all states at least every four years but most frequently once a year. Students who did not complete their programs (leavers) were followed-up as frequently with the exception of a low placement site in State C. that never surveyed leavers. Student data were collected annually or semiannually in all states except State C, where it was collected every four years or never. Employers were surveyed annually or semiannually with some exceptions.

As the data in table 89 show employers who responded to the mail ques 'onnaire were asked to rate the quality of their workers who had been vocational-technical education students. majority of the employers in State A and D rated their workers as excellent or good, whereas the majority in States B and C rated them good or fair. Few employers rated their workers poor (0 to 8 percent) or as not meeting their business' needs (0 to 10 per-In State B, 27 percent of the employers in the high placement sites and 18 percent of the employers in the low placement sites indicated they had no basis for rating, whereas in the other states 2 to 17 percent indicated that they had no basis for rating the quality of their employees who had been vocational-. technical education students. Employers were also asked to compare workers who had been in vocational-technical education on a number of factors with those who did not have vocationaltechnical education. In table 90 the data show that employers believed workers who had been in vocational-technical education

programs had: (1) better reading and interpretive skills, (2) better mathematical knowledge, (3) better or same knowledge/skills dealing with safety, (4) the same personal relations skills, (5) better communication skills, (6) better or same for work attitudes, (7) better or the same supervisory skills, (8) the same psychomotor skills, and (9) better occupational skills. In States A and D, 20 to 27 percent of the employers indicated the occupational skills of workers who had been in vocational-technical education were much better than those who had not had vocational-technical education. Employers gave few (0 to 11 percent) "worse" or "much worse" (0 to 5 percent) responses, with work attitudes receiving the greatest percentage of "worse" or "much worse" responses.

Employers rated the postsecondary institutions in terms of the numbers of students trained to meet their needs (see table 91). In States A, B, and D the number of students trained was generally given a good rating by employers. At the high placement sites in State C the rating was "fair" for number of students trained with a third of the employers not responding. At the low placement sites the most typical rating for number of students trained was good. In State D a fifth of the employers felt the numbers trained were excellent. Few (0 to 6 percent) of the responding employers felt the numbers did not meet their needs, although some (2 to 24 percent) indicated that they had no basis for rating the number of students trained.

Summary. Findings from the study indicate that various program evaluation procedures were conducted at all of the participating sites. At case site A, which had the highest job placement rate, the evaluative criterion was explicitly related to the job placement rate. Although other criteria regarding the quality and objectiveness of the programs were considered, at sites with the highest job placement rates, job placement rates were clearly important in the evaluation of the vocational-technical education programs. Additionally, at these sites the recommendations resulting from the evaluations were used to improve the program in order to maintain or enhance the job placement rates. There appeared to be a strong positive relationship between high job placement rates and comprehensive program evaluation that not only used job placement rates as an evaluative criterion but followed through with the recommendations for program improvement.

Additional Results From The Analysis
Of Mail Questionnaires and Selected Existing Data

Correlational Analysis

Introduction. This section reports the results of a correlational analysis of selected variables from the mail questionnaire survey. One hundred sixty-three variables were used in the

initial analysis to identify the degree of relationship with the study's independent variable—the percentage of placement in related field of training for former postsecondary vocational—technical education students. The percentage of placement was derived from the local adacation agencies' follow—up study of former students who were available for employment and who reported that they were employed in a job related to their training.

It must be stressed, however, that because of the large number of coefficients, and the use of aggregate data, or "ecological fallacy" (Robinson 1950) caution is offered regarding the interpretation of individual-level variables based on the analyses of data aggregated by LEA and respondent group(s). Also, since it is an exploratory study, some of the relationships between variables will defy interpretation because of a lack of pertinent information relating to the variables. It is intended that all significant relationships be further explored before strong statements are m_k . Borgatta and Jackson (1980) indicate that the interpretation of aggregate data, although always suspect, could suggest findings that exist at the individual level. Moreover, they add that a tempered consideration be provided if certain statistical and logical considerations are undertaken.

The identification of the 163 variables for the initial analysis was done through a consensus of the project staff. This determination was based on their analysis of information generated from the review of literature, the case studies, experience of staff in the area of job placement, and the results of the project dealing with the "Factors Relating to the Job Placement of Former Secondary Vocational Education Students."

Job placement rates were available only by postsecondary institution, therefore, it was decided that the respondents' mail survey answers to selected questions would be aggregated to derive a mean score by the postsecondary institution. Thus, the individual mean score of a mail survey item and the postsecondary mstitution job placement rate provided the paired scores neces- , sary to compute the correlation coefficient. For example, teachers, counselors, job placement specialists, and directors were used in the analysis as one respondent group classified as school personnel. And the responses of those individuals to a certain item_were pooled for each postsecondary institution, and then a mean was computed for the postsecondary institution and correlated with the postsecondary institution's training related placement rate. Other respondent groups used in the analysis current and former students, employers and advisory council members. The rationale for these groupings of respondents was based upon the project staff's decision to combine those respondent groups who had common interest, experience, or influence with regard to specific variables or categories of variables.

Findings. The results of the correlational analysis of 163 variables with the variable job placement in related field, using all respondent groups or those who were asked a common core of questions revealed that thirty-eight variables were significant at the .Q5 level of significance. Table 92 shows the correlations by respondent group.

Where the respondents believed that a primary goal of vocational education is training for a job or more specifically for a job in a related field there was a positive relationship (r=.55) with percentage of job placement in related field. For those respondents who perceived the goal of vocational education to be exploratory or awareness in focus a negative relationship (r=-0.48, -0.58) with the percentage of job placement in related field was found, i.e., the higher ranking of a goal for vocational education as not relating to job specific preparation the lower the placement rate in related field. Perceptions about factors helping former students to obtain jobs revealed that the greater the degree that basic skills are perceived in enhancing an individuals chance for obtaining a job the less the job placement in related field (r=-0.32). Vocational-technical education students having previous work experience was found to be a positively related (r=0.41) with job placement rate in related field.

The perceptions of factors that were considered as posing difficulties for former students in obtaining jobs included: union restrictions (r=-0.38), minimum wage (r=-0.36), not having specific job skills (r=-0.40), lack of certificate or associate degree (r=-0.52), and lack of transportation (r=-0.46). These factors were found to be negatively related to job placement in related field of training, i.e., the more these factors were perceived as difficulties in obtaining jobs the lower the placement rate in related field.

A negative correlation (r=-0.48) was found between the percentage of time spent by school personnel in providing assistance in educational placement and the percentage of job placement in related field. Moreover, a negative relationship (r=-0.56) was found between the rating of the school's performance in providing assistance in advanced educational placement and job placement in related fields. Opinions about the help received in obtaining information about jobs resulted in positive correlations that indicated that the amount of help former students received from vocational education teachers (r=0.62) and the public employment service (r=0.34) the higher the job placement rate in related field.

The frequency with which teachers and job placement specialists participate in job readiness and development activities such as identifying job openings by placing advertisements in media, (r=0.44) contacts with the public employment service (r=0.33),

and use of computerized files of job openings (r=0.35) resulted in a positive correlation with job placement rate in related field.

A negative relationship was found between using a minimum 'grade point average or standarized tests for admissions (r=-0.30) to vocational programs and job placement in related field. There was negative relationship (r=-0.45) between the amount of time students worked while in school, and the placement rate in related field, however this relation ship did not hold for students in a job that was part of a cooperative or work study program. The degree of self-confidence in finding a job (r=0.31) expressed by vocational-technical education students was found to be positively related to job placement in related field.

Tables 93 through 99 present the correlations (p \leq .05) by respondent group. As stated earlier the raionale for aggregating respondent groups was based upon the project staff's decision that certain groups had common interests, experiences, or influence with regard to specific variables or categories of variables.

In examining the correlational analysis for the respondent group school personnel (teachers, counselors, job placement specialist, directors) eight correlation coefficients were statistically signficant at or beyond the .05 alpha level. an examination of table 93 the significant correlation coefficients between the percentage of job placement in related field and the perceived ranking of the goals of vocational education were those dealing with placement in related field (r=0.62), placement in a job including nontraining related (r=0.59), creating an awareness of the various jobs for which students might prepare (r=0.59), and providing an opportunity for students to explore various occupational areas (r=-0.46). Opinions about the amount of difficulty of selected factors (union restrictions (r=-0.35), lack of transportation(r=-0.36), lack of certificate or associate degree (r=-0.44), and personal opinion about the amount of help human relations skills have in increasing the chances of employment for former vocational students (r=-0.43).

Fourteen correlation coefficients significant at or beyond the .05 alpha level were identified for the respondent group current and former students. From an examination of table 95 the significant correlation coefficients were those dealing with opinions concerning the degree of help certain factors are in obtaining a job [basic skills (r=-0.47), occupational skills and competencies (r=-0.32), human relations skills (r=-0.44), previous work experience (r=-0.32)]; opinions regarding amount of difficulty the lack of job openings poses for vocational-technical education graduates when they are attempting to obtain jobs after leaving school (r=0.40); perceptions about the amount of help selected factors [job information provided by the vocational

teacher (r=0.61), cooperative education coordinator (r=0.3 $\frac{1}{3}$), public employment service (r=0.29)] were in helping former students obtain jobs; response to the evaluation of performance on selected employability skills activities [performance in writing resumes (r=0.38), performance in locating jobs (r=0.31), performance in filling out a job application (r=0.52), performance in setting up job interviews (r=0.44), performance in interviewing with prospective employers (r=0.32)); and number of Fourses completed in vocational area of study (r=-0.46)].

For the respondent group "employer and advisory council members" eight correlation coefficients were found to be significant at or beyond the .05 alpha level. In examining table 98 the significant correlation coefficients were those dealing with the perceived ranking of the goals of vocational-technical education to place former students in jobs related to their training (r=0.37), and to create an awareness of various jobs for which students might prepare (r=-0.39). Also, significant correlation coefficients were found regarding opinions about the difficulty certain factors pose for vocational students when they are attempting to obtain jobs. These factors included lack of certificate or associate degree (r=-0.47), lack of transportation (r=-0.42), job discrimination because of age (r=-0.35), union restrictions (r=-0.34), minimum wage (r=-0.30), and lack of specific job skills (r=-0.30).

Table 105 presents a summary of the significant results emerging from the correlational analysis of the mail questionnaire data. Correlations significant at or beyond the 05 alpha level by respondent group are shown.

Regression and Discriminant Function Analyses

Introduction. In this section additional information is provided about the analysis of the mail questionnaire data and selected existing data related to the local postsecondary institutions' labor market areas.

Separate regression analyses and discriminant analyses were done for the data for the thirty-one local public postsecondary institutions. Through previously mentioned procedures such as the review of literature, case studies, correlational analysis, and crosstabulation of mail questionnaire data a reduced number of variables were identified for the regression and discriminant analyses. The following respondent groups: school personnel (teachers, counselors, job placement specialists, directors), current and former students, and employer and advisory council members were used in the initial analyses effort.

As discussed previously the unit of analysis was the local

public postsecondary institution. Therefore, for each independent variable used in the analysis of the mail questionnaire data set and selected existing data pertaining to the labor market area served by the local public postsecondary institution, a mean was calculated based upon the responses of the various groups comprising the sample of each local public postsecondary institution.

Specifically this part of the analysis of the mail questionnaire data and selected existing data are reported as they pertain to the following study objective:

To provide a detailed description of the educational and community processes which appear to influence former vocational-technical education students in jobs related to their training.

The statistical data are presented and discussed in this section only to the extent needed to interpret the meaning of the statistics used. Certain results were discussed in previous sections of this chapter. However, impressions, conclusions, and recommendations for further study are presented in a later section.

Tables 100-102 present individual respondent group regression analyses which were done to identify significant variables which were highlighted in the review of literature, project staff experience and consultation, and case studies.

After the multiple regression analyses for each separate respondent group were conducted variables common to all respondent groups and selected variables from the analysis of existing data portion of the study were combined into one common data set. Using this set, additional multiple regression and discriminant analyses were performed to produce a reduced model (see tables 103 and 104).

Regression analysis. Using a forward (step-wise) inclusion method technique a reduced model was computed in order to identify the most unique and useful information for description. The results of the reduced model are presented in Table 102. The multiple correlation (R) obtained from this analysis was equal to appproximately 0.87. The unadjusted coefficient of determination was equal to 0.76, the adjusted coefficient of determination (R-2) is equal to approximately 0.65. The significance of the total relationship as tested by the overall F-ratio is equal to 6.50 and is significant beyond the .01 alpha level.

The standardized Beta coefficient represented the amount of units of the independent variable, which was uniquely associated with the percentage of job placement, with the effect of partialing out all other independent variables. Because the

measurement units of various independent variables in a number of cases were not comparable the standardized Beta coefficients were used. Ezekiel and Fox (1967) state that for comparisons between problems where the standard deviations are much different, the standardized Beta coefficient may have value.

Examination of the standardized Beta coefficient in this reduced equation indicated that the following variables were significant beyond the .05 alpha level: the evaluation of students in regards to the job application process (employability skills), the vocational education teacher as a source of information for finding jobs, the evaluation of students in regard to writing resumes (employability skills), and the unemployment rate.

Discriminant function analyses. A discriminant function analysis was used to determine a combined discriminant strength the selected independent variables have in maximizing the total differences between the high and low placement groups. Table 104 presents the results of this analysis for the reduced model. The information contained in the six independent variables was sufficient to produce a significant discrimination between the high placement and low placement postsecondary institutions.

A step-wise selection procedure resulted in the subset of six variables being derived from a full set of sixteen variables. The Wilkes Lamba statistic to sequal to approximately .49, and the chi square value was equal to 18.56 and was significant at the 0.00 level. Examining the canonical correlation (r*), the value was equal to approximately .71. The correlation squared (r*2) approximated a value of .50, which showed that a substantial relationship existed between the high and low placement groups and the discriminant function. The discriminant function correctly classified 87.10 percent of the cases. The tau statistice was equal to .77, which indicated that the classification based on the set of discriminating variables made 77 percent fewer errors than would be expected by chance alone. fic variables used in the reduced model were: (1) evaluation of students ability on completing job applications (employability skills), (2) goal of job placement in related field, (3) unemployment rate, (4) population change between 1970-80, (5) number of business and industrial firms, and (6) numbers of large business and industrial firms located in a particular labor market area.

Summary

This phase of the data analysis using the mail questionnaire and selected variables or existing data was exploratory in nature. The type of study and statistical analyses are not appropriate to infer causal relationships.

Table 105 lists variables having significant relationships with percentage of job placement in related field of former post-secondary vocational-technical education students. The zero order correlation analysis and the regression and discriminant functions analysis were the statistical techniques used to identify those relationships.

In summary thirty-nine variables were found to be significant beyond the .05 alpha level using zero order correlational analysis. The variables found to be significantly related to the percentage of placement in related field of training included the perception of the goals of vocational-technical education; factors perceived as posing difficulties for former students in obtaining jobs such as lack of transportation, lack of associate degree and union restriction; efforts and focus of the individual institut n in providing employability skills training; and the assistance of the vocational-technical education teacher.

The multiple regression analyses and discriminant function analysis provided further information in regard to the suggested relationships of certain independent variables with percentage of job placement in related field. The variables dealing with the importance of employability skills; the vocational-technical education teacher as a source of information about job; the unemployment rate; the population change 1970-80, and the type and number of business and industrial firms in the labor market apeared as major factors. However, other analysis did not provide strong support for certain variables such as unemployemnt rate, population change 1970-80, and the type and number of business and industrial firms. This lack of a congruence among and between data bases, nevertheless, should not defer further further exploratory or confirmatory study. More pertinent information relating to the variables in question is needed.

CHAPTER IV

CONCLUSIONS, RECOMMENDATIONS, AND SUGGESTIONS FOR ADDITIONAL RESEARCH

Before presenting conclusions, recommendations, and suggestions for additional research, it is appropriate to recall some of the methodological dimensions and limitations of this study. We cannot state with any degree of certainity that the sample states, postsecondary institutions, or individual respondents are representative of the respective populations from which they were drawn. A more valuable viewpoint is to consider the findings transferable to other postsecondary institutions to the extent that those postsecondary institutions possess characteristics similar to the postsecondary institutions described in this study.

One of the strengths of postsecondary education in the United States has been its diversity of goals, programs, students, staff, resources, method of instruction, and the type of community served. The attention postsecondary educators have given to the unique needs and interests of the community being served has contributed inmeasureably to the success of postsecondary education. Those who study postsecondary institutions must be keenly aware of the context specificity of the enterprise they are studying. It is these characteristics that underscore the importance of the point made earlier concerning the necessity to consider the findings of this study transferable to other postsecondary institutions only to the extent that those postsecondary institutions possess characteristics similar to the postsecondary institutions described in this study.

Multiple goals are operationalized simultaneously for many vocational-technical education programs. The dependent variable used in this study, placement in a job related to training, was not viewed by all policymakers and decision makers who participated in the study as the major criterion for planning and evaluating vocational-technical education programs. It is important to realize that there is a considerable amount of diversity in the goals for vocational-technical education programs. Such diversity about program goals makes it somewhat difficult to formulate conclusions about the factors relating to the placement of students in jobs related to training from data collected within a postsecondary institution and certainly from data collected across postsecondary institutions in different states.

This study represented an attempt to analyze qualitative and quantitative data from several different sources. In addition, the extent of the data collected and the large number of variables dealt with created special analysis problems.

It can be argued that insufficient time was spent at the case study sites. Perhaps fewer sites and longer time spent per site would be a better approach. However, the choice of at least one case study site per state provided valuable insights as the staff analyzed the data.

It should be evident to the reader that this study represents a compilation of data from many sources. The credibility of the findings is enhanced by the fact that the findings could be substantiated by data from multiple sources.

Conclusions

The conclusions that follow are based on the integration of qualitative and quantitative data. Specifically, three data bases were examined. They included the review of literature, case studies (four postsecondary institutions), and mail questionnaires (eight respondent groups in thirty-one postsecondary institutions). The following statements should not be regarded as final conclusions concerning the factors affecting the placement of former students in jobs related to their training. The statements should be considered as working hypotheses, to be tested again and again in the ever-changing context in which postsecondary vocational-technical education programs operate. If vocational-technical educators are to maximize the placement of former students in jobs related to their training, it appears that the following points should be given careful attention.

Education

Higher job placement seems to exist in those postsecondary institutions where:

- o Postsecondary institution personnel and teachers are committed to the placement of students in a job related to training as the major goal for the vocational-technical education programs
- o Postsecondary institution personnel are enthusiastic about the placement of students in a job related to their training as the major goal for the vocational-technical education programs

- o Teachers are enthusiastic about the role they play in ensuring that students are placed in jobs related to their training
- o Administrators are committed to and encourage the essential interactions among community organizations, labor, business, industry, and postsecondary institution personnel, that promote open communication to support job placement
- o Teachers maintain frequent and meaningful contacts with the business and industrial community
- o The vocational-technical education curriculum is relevant and responsive to the needs of employers
- Job placement specialists and counselors serve as initial sources of information about job openings for teachers and students
- o Job placement specialists and counselors provide a clearinghouse function and a support function (secretarial assistance, telephone, job listings) for information about jobs
- Advisory committee input is used in planning vocationaltechnical education programs
- o Planning in the postsecondary institutions is coordinated with community and state economic development activities, especially those activities related to labor supply and demand
- o Job placement rates are used as a program evaluation criterion
- Program evalution efforts are systematic and comprehensive
- o Student performance is evaluated on employability skills such as preparing resumes, and interviewing
- o Teachers keep up to date with the latest trends in the occupational fields

127

o Programs providing students with freal world" work experiences are available to students

Labor

Higher job placement seems to exist in those postsecondary institutions where:

There is a high demand for workers in the surrounding labor market area. However, high labor demand does not always result in high job placement. Higher job placement tends to result when the post secondary institutions vocational-technical education programs are specifically oriented to the high-skill labor demand areas. Labor market conditions over which vocational-technical educators have no control are at least as important as the nature of vocational education itself in determining job placement

e Community

Higher job placement seems to exist in those postsecondary institutions where:

- o The community is supportive of vocational-technical education
- O The postsecondary institution is located in middle-size communities

Recommendations

The study recommendations are directed toward agencies or policymaking groups who have historically developed and/or enforced policies and decisions regarding vocational-technical education programs.

Policymakers and decision makers interested in optimizing the placement of former postsecondary vocational-technical education students should give careful attention to the following recommendations. All of the recommendations deal with education factors over which vocational-technical educators have some control. Labor market and community characteristics that are associated with high rates of job placement are beyond the control of vocational-technical educators.

The recommendations were derived from project staff analysis of the study conclusions juxtaposed with study staff knowledge of current situations in vocational-technical education. Other individuals operating from a different frame of reference may develop additional recommendations.

Congress

It is recommended that Congress:

- Recognize that vocational-technical education programs operate with multiple goals and therefore not specify specific criteria for the evaluation of such programs
- o Develop legislation that is flexible enough to allow state agencies to develop funding formulae that will encourage postsecondary institutions to conduct activities enhancing job placement

U.S. Department Education

It is recommended that the U.S. Department of Education:

- o Encourage further research about the factors relating to job placement especially in isolated areas, inner cities, and areas with unique labor market or geographical locations
- o Encourage the dissemination of findings regarding the factors relating to job placement through the funding of symposia, workshops, monographs, and widely-distributed publications

State Government Agencies

It is recommended that state governing agencies:

- Develop funding formulae that reward postsecondary institutions for implementing activities that enhance job placement
- Provide teacher education institutions and postsecondary institutions with funding to conduct inservice education programs for teachers and administrators concerning the factors relating to job placement
- o Promote professional development activities that assist teachers in keeping up to date in their occupational skill area

Postsecondary Institutions

It is recommended that postsecondary institutions:

- Develop clear statements of the goals for postsecondary vocational-technical education programs
- Promote and reward enthusiasm for placing students in jobs related to training

- Encourage frequent and active meetings of citizen advisory committees and utilize their recommendations.
 in program planning and evaluation
- Use job placement data as a major criterion for evaluating programs
- o Recognize the importance of the role of teachers in the job placement process by including teacher performance concerning job placement in tenure, promotion, and salary adjustments
- o Recognize the importance of the role played by chief administrators and deans/directors in the job placement process. Reward chief administrators and deans/directors for their leadership and allocation of resources to attain institutional goals concerning job placement
 - o Develop and maintain systematic processes for ensuring that the vocational-technical education curriculum is relevant and responsive to the needs of business and industry
 - o Develop and maintain current and relevant job placement information in a central location that is easily accessible to teachers, job placement specialists, counselors, administrators, and students
 - O Use local labor market information in program planning and evaluation
 - o Maintain close contact with other agencies involved in job development/job placement in the community

Teacher Education Institutions

It is recommended that teacher education institutions:

- o Include in the courses required for postsecondary institution administrators information concerning the goals of postsecondary vocational-technical education programs, information about those factors enhancing the attainment of the goals, and information about the vital role of deans/directors in determining whether former students are placed in jobs related to their training
- o Impart to future vocational-technical educators the significant role teachers play in determining the placement of former students in jobs related to their training

o Seek innovative ways to provide current education personnel with information about methods that will enhance job placement

Suggestions for Additional Research

Numerous questions arose as the project staff planned and conducted the study. The breadth and complexity of the concerns and issues surrounding a postsecondary institution's efforts to assure that students are placed in jobs related to their training needs considerable study. The following null hypotheses are presented as suggestions for additional research:

- o There is no relationship between job placement rates and a clear understanding on the part of administrators and teachers regarding the primary purpose of the vocational-technical education programs in their institutions
- o There is no relationship between job placement rates and consistency of belief among administrators and teachers in a postsecondary institution concerning the purpose of vocational-technical education
- o There is no relationship between job placement rates and the degree of commitment on the part of deans/directors to job placement
- o There is no relationship between job placement rates and the level of enthusiasm for job placement among postsecondary institution staff members
- o There is no relationship between job placement rates and student admission procedures
- o There is no relationship between job placement rates and the amount of responsibility teachers believe they have for placing their students in jobs
- o There is no relationship between job placement rates and the degree to which cooperative education programs place students in jobs related to their training programs
- o There is no relationship between Job placement rates and labor market demand in the surrounding area
- o There is no relationship between yob placement rates and the proportion of large to small industries in the community
- o There is no relationship between job placement rates and the proportion of nonwhite persons in the community

- O There is no relationship between job placement rates and the frequency with which results from surveys are used to plan and evaluate vocational-technical education programs.
- O There is no relationship between job placement rates and the frequency of contacts between vocationals technical education teachers and employers regarding the job placement of students
- O There is no relationship between job placement rates and institutional operation of a centralized job placement service
- O There is no relationship between job placement rates and the degree to which institutional job placement offices include teachers in job placement activities
- O There is no relationship between job placement rates and the degree to which students are provided with job readiness skills
- There is no relationship between job placement rates and student basic skill achievement
- o There is no relationship between job placement rates and available transportation to and from jobs
- O There is no relationship between job placement rates and the size of the community
- o There is no relationship between job placement rates and the resource levels provided the vocational-technical education program

JOB PLACEMENT IN VOCATIONAL-TECHNICAL EDUCATION

Conducted by: The National Center for Research in Vocational Education, The Ohio State University	Sponsored by: Office of Vocational and Adult Education U.S. Department of Education In cooperation with your State Postsecondary Vocational-Technical Education Governing Agencies
Why we need your help Your school is helping in a national study on vocations	al-technical education. You have been selected as a
representative of your school to help with this job place	cement study. Your answers are very important, on. This study, authorized by P. L. 94–482, is voluntary.

On the next page, you will find questions about vocational-technical education students finding jobs. Most questions can be answered by placing an "X" or a check mark "\" in the box, or by filling in the blanks. Please answer all items as accurately as possible. If you are unsure of a response, leave that question or that part of the question blank. Example 1: How many persons teach vocational-technical education classes in your school? In your personal opinion, how important are the following factors for vocational-technical Example 2: education students in obtaining jobs? (Check the appropriate box for each of the following.) Extremely Somewhat Very A Little Not at All **Important** Important Important **Important** Important 1. Appearance 4 2. Grades سمعا 3. Personality [] U___

Please return the completed questionnaire in the postage-paid, pre-addressed envelope provided. Thank you for your help.

We will protect your confidentiality to the fullest extent allowed by law. The code found on the last page of this instrument indicates the state in which you live, the school, and a number identifying you as the person responding to this questionnaire. However, in the analysis no information will be associated with your name.

JOB PLACEMENT IN VOCATIONAL-TECHNICAL EDUCATION

Conducted by.
The National Center for
Research in Vocational Education
The Ohio State University

Spensored by
Office of Vocational and Adult Education
U.S. Department of Education
In cooperation with your State
Postsecondary Vocational-Technical
Education Governing Agencies

Why we need your halp ...

Your school is helping in a national study on vocational-technical education. You have been selected as a representative of your school to help with this job placement study. Your answers are very important, and will help to improve vocational-technical education. This study, authorized by P.L. 94-482, is voluntary.

How you can help.

On the next page, you will find questions about vocational-technical education students finding jobs. Most questions can be answered by placing an "X" or a check mark "\ref" in the box, or by filling in the blanks. Please answer all items as accurately as possible. If you are unsure of a response, leave that question or that part of the question wank.

Example 1 How many persons teach vocational technical education classes in your school?

Example 2. In your personal opinion, how important are the following factors for vocational-technical education students in obtaining jobs? (Check the appropriate box for each of the following)

Extremely Very Somewhat A Little Mot at All Important Important Important Important Important

1. Appearance

2 Grades,

3 Personality

Please return the completed questionnaire in the postage paid, pre addressed envelope provided. Thank you for your help.

We will protect your confidentiality to the fullest extent allowed by law. The code found on the last page of this instrument indicates the state in which you live, the school, and a number identifying you as the person responding to this questionnaire. However, in the analysis no information will be associated with your name

JOB PLACEMENT IN VOCATIONAL-TECHNICAL EDUCATION

Conducted by: The National Center for Research in Vocational Education, The Ohio State University

Sponsored by:
Office of Vocational and Adult Education
U.S. Department of Education
In cooperation with your State
Postsecondary Vocational-Technical
Education Governing Agencies

Why we need your help ...

Your school is helping in a national study on vocational-technical education. You have been selected as a representative of your school to help wind this job placement study. Your answers are very important, and will help to improve vocational-technical education. This study, authorized by P. L. 94-482, is voluntary.

How you can help . . .

Example 1:

On the next page, you will find questions about vocational-technical education students finding jobs. Most questions can be answered by placing an "Xi" or a check mark " $\sqrt{}$ " in the box, or by filling in the blanks. Please answer all items as accurately as possible. If you are unsure of an answer, leave that question or that part of the question blank.

In how many full-time jobs did you work before enrolling in your current

	yocational-technica	il education pr	ogram?					
Example 2:	In your personal op students in obtaining	pinion, how im ig jobs? (Chec	portant are i k the appro	the following priate box fo	g factors for or each of th	vocational-technical e following.)		
		Extremely Very Somew		Somewhat Important	A Little Important	Not at All Important		
	1. Appearance	13		Ø				
•	2 Grades	()	المعا	u -	Ð	u ;		
•	3. Personality		[_]	ĺΠ		Ο,		

Please return the completed questionnaire in the postage-paid, pre-addressed envelope provided. Thank you for your help.

We will protect your confidentiality to the fullest extent allowed by law. The code found on the last page of this instrument indicates the state in which you live, the school, and a number identifying you as the person responding to this questionnaire. However, in the analysis no information will be associated with your name

14	Low	30	High
15	High	31	High
16	Low	31	High

The median placement rate was calculated individually for each state in the study. Postsecondary schools with rates below the median split were classified as low placement sites while those above were classified as high placement sites. Placement rates were those reported by the state vocational education agencies for 1979. The median for the states was: A = 96, B = 83, C = 68, and D = 55.

b Also served as case study site.

APPENDIX E
DEFINITION OF TERMS

DEFINITION OF TERMS*

Civilian Labor Force: All civilians sixteen years of age and over who are classified as either employed or unemployed.

Completer, Program (Vocational Education): A student who finishes a sequence of courses, services, or activities that are designed to meet an occupational objective and that purports to teach entry-level skills.

Cooperative Education: A combination program of vocational study and practice for persons through written cooperative arrangements between school and employer. The program offers instruction, including required academic courses and related vocational preparation, by alternating study in school and supervised on-the-job training.

County: The largest local administrative subdivision of most states

Course: An instructional unit of an area or field, or organized subject matter and related learning experiences usually provided for the instruction of students on a quarter, semester, year, or other prescribed length-of-time basis. It can be offered for credit or non credit.

<u>Demographic Information</u>: Describes the population within a specified geographic area in terms of number, age, ethnic composition, sex, work, status, and/or other pertinent information

Employee: A person hired by another or a business, firm, and so forth to work for wages or salary.

Employer Specifications: Required skills, knowledges, aptitudes, attitudes, training, or education, personal appearance, and job prerequisites (such as license, certificate, union membership) demanded or desired of an applicant by employer.

Selected publications from the U.S. Department of Labor and the U.S. Department of Commerce, Bureau of the Census.

461

€

^{*}Source: National Occupational Information Coordinating Committee. Glossary of Terms and Definitions Used in An Occupational Information Program. Draft Copy. September, 1978.

Employment Training: Training designed to enhance the employ-ability of individuals by upgrading basic skills through such course as remedial education, work orientation, English as a Second Language, or training in the primary language of persons of limited-English usage. The courses may be offered as part of institutional training.

Entry Level: The lowest position in any promotional line

Full-time Employed: Person working thirty-five hours or more per week.

Hiring Specifications: Requirements established by the employer which must be possessed by the applicant prior to employment. Examples of these are union membership, license, certification of education, health, attitude, and appearance.

Industry: The production activities of the United States economy. An industry is a private, public, and/or nonprofit productive enterprise engaged in producing goods or servcies. The basic unit of classification in an industry on the basis of its principal activity.

Job: A position or employment situation; work, either paid or unpaid.

Job Development: The process of soliciting a public or private employer's orders for a specific applicant for whom no suitable opening is on file. May also refer to solicitation of jobs for groups of applicants who may be available in large numbers.

Job Opening: A single job vacancy for which the Employment Service office has on file a request from and employer to select and refer an applicant or applicants.

Job Skills: Competencies imparted to or possessed by persons to prepare or make them acceptable for employment (paid or unpaid) in a specific occupation or a cluster of closely related occupations in an occupational field,

Job Vacancies: Actual jobs that are immediately available for filling, and that the employer is actively trying to find or recruit workers from outside the firm.

Labor Demand (Current): Total employment plus the number of job vacancies existing. May be referred to in terms of industry demand or occupational demand.

Labor Demand (Projected): The number of job opportunities or job openings expected to occur over a given period of time because of change in employment levels and the need to replace workers who die.

<u>Labor Market</u>: The entire set of interlinked institutions and processes that determine the flows of job opportunities and labor supply in both the short and long run.

Labor Market Area (see Standard Metropolitan Statistical Area):
An economically integrated unit in which workers may readily change jobs without changing their place of residence. The boundaries depend primarily on economic and geographic factors, and not or political jurisdictions. Many labor market areas aralso SMSAs.

Labor Supply: The number of persons working or available for work, i.e., the employed plus the unemployed. May refer to the current situation or to expectations for the future.

Leaver, Program: A student who has been enrolled in and has attended a vocational education program and has left the program without completing it. Also includes those who leave the program voluntarily before completion, but leave with marketable skills, i.e., will be capable of obtaining and performing the job for which preparation was directed.

Management Information System: An reganized method of providing past, present, and projected information relating to internal operations and external intelligence that supports the planning, control, and operational function of an organization by providing decision makers with uniform information in the proper time frame.

Marketable Skills: Competencies in a specific occupation or cluster of related occupations obtained by persons through training or other job preparation that meet the hiring specifications of local employers.

Metro: Means that a county is located within a SMSA.

Nonmetro: Means that a county is located outside the boundaries of an SMSA.

Occupation: The name or title of a job that identifies and specifies the various activities and functions to be performed.

Occupational Objective (Education): The expected outcome of training and other preparation as started by an individual student. The objective usually is stated in terms of a specific occupational title.

<u>Placement</u>: The obtaining by individuals of unsubsidized employment either as a result of his own efforts after intake services or by referral to a job by the school or public employment services.

Placement Services (Education): Activities organized to help students in appropriate educational situations while they are in school, in appropriate part-time employment while they are in school, and in appropriate educational and occupational situations after they leave school, and to facilitate students; transition from one educational experience to another. This may include, for example, admissions counseling, referral services, assistance with records, and follow-up communications with employers concerning the performance of former students.

Per Capita Income: A measure of income by unit of population (per person).

<u>Program (Education)</u>: Planned sequence of course, services, or activities designed to meet an occupational objective.

Related Occupations: Occupations that are determined to be related on the basis of similar job or worker's characteristics required for successful worker performances. Examples of such characteristics are experience, training and education, duties performed, tools, machines, and other aids, and materials used on the job.

Specific Vocational Preparation (SVP): The amount of time required to learn the techniques, acquire information, and develop the facility needed for average performance in a specific jobrelated situation. This training may be acquired in a school, work, military, institution, or a vocational environment. It does not include the orientation training required by a fully qualified worker to beome accustomed to the special conditions of any new job. Specific vocational training includes training given in any of the following circumstances:

- 1. Vocational education
- 2. Apprentice training
- 3. In-plant training
- 4. On-the-job training
- 5. Essential experience in other jobs

Standard Metropolitan Statistical Area: A county or group of contiguous counties containing at least one city with a population of 50,000 or more and that are economically and socially integrated with central city. The boundaries may cross state lines. All SMSAs are coterminous with labor market areas.

State Board: A state branch designated or created by state law as the sole state agency responsible for the administration of vocational education, or for the supervision of the administration of vocational education in the state.

464

State Education Agency: State board of education or other agency or officer primarily responsible for the state supervision of public elementary and secondary schools, or, if there is not such officer or agency, an officer or agency designated by the governor or by state law.

Student (Vocational Education): An individual with a vocational objective who is enrolled in a vocational education program leading to entry or progress in a chosen occupational field.

Technical Education: A program of studies designed primarily to prepare persons for work in the occupational area between that of the skilled and the professional employee. This includes programs for training and retraining and leads to qualification for work as a technician.

APPENDIX F
NONRESPONDENT ANALYSIS

NONRESPONDENT ANALYSIS

A mail questionnaire return rate of 24 percent provides a base for questioning the representativeness of the respondents with respect to the population being surveyed. Moreover, one must examine the findings and the interpretation of the results based on differences between nonrespondents and those persons or respondent groups who did respond to the initial survey. Kerlinger (1973) stated,

Every effort should be made to obtain returns of at least 80 to 90 percent or more, and lacking such returns, to learn something of the characteristics of the nonrespondents (p. 144).

However, others take a more moderate position with respect to response rates. Leslie (1972) offers the following position to respond to the prevalent belief that response bias severely limits the usefulness of surveys and questionnaires which did not have 100 percent response rate:

- There is ample evidence that response rate bias may occur in mail surveys. However, much of the available evidence reveals only differences between respondents and nonrespondents or late respondents in terms of such independent variables as sex, geography, age, etc. It is often assumed that these differences lead to differences between respondents and nonrespondents on the dependent variables, i.e. the questions under study.
- when populations surveyed are homogeneous (having a common group identity), minor differences on independent variables between respondents and nonrespondents or late respondents may occur, but differences as to dependent variables are unikely (p. 328).

Further Leslie (1972) concludes that when surveying homogeneous groups one need not be overly concerned about the response rate, just that enough responses are achieved to meet statistical assumptions.

A nonrespondent survey was conducted to determine if nonespondents as a group differed systematically from those members of the population who did respond. A few "check" questions were used to compare nonrespondent percentages with percentages of those who did respond to the initial mailing of the questionnaire.

Tables 106 and 107 present data comparing group (i.e., teachers, employers, etc.) representation of respondents from the initial survey and the nonrespondents. Tables 108-111 present frequencies on variables such as race/ethnic orign, sex, age, level of education. Table 112 shows the results of a test significance of difference between the means of the nonrespondent sample and the respondent sample on twenty-five selected variables from the questionnaire. A significant difference between the means of respondent and nonrespondent were found in three of the twenty-five variables examined.

470
